PODOSTEMACEAE
川苔草科  chuan tai cao ke

Herbs, annual or perennial, aquatic. Roots usually flattened, thalloid or filiform. Leaves distichous, scattered, or imbricate, base often sheathed, margin entire or dissected. Flowers bisexual, solitary, actinomorphic or zygomorphic, enclosed or not by a spathella or spathella lacking. Tepals 2–5, free or ± connate. Stamens 1–4, hypogynous; filaments free or partially connate; anthers 2–4-loculed, longitudinally or irregularly dehiscent. Ovary superior, 2- or 3-loculed; ovules numerous, placenta central. Styles 2 or 3. Fruit a septicidal capsule. Seeds numerous, minute, without endosperm.

About 40 genera and 200 species: widespread in tropical regions, a few species in temperate regions: three genera and four species (two endemic) in China.

The plants live attached to submerged rocks or wood in rushing water in rapids or cataracts of streams and rivers. They are easily overlooked, and more field work is needed in China.

1. DALZELLIA Wight, Icon. Pl. 5: 34. 1852.

川藻属  chuan zao shu

Terniopsis H. C. Chao.

Herbs, perennial. Roots flattened, branched. Stems arising laterally from root, distichous, simple or shortly branched. Leaves small, elliptic, flattened, sessile, imbricate in 3 ranks, smaller on lateral ranks. Flowers 1 or 2, axillary to basal leaf, sessile, subtended by 2 bracts; bracts unequal, opposite. Tepals 3, membranous, basally connate. Stamens 2 or 3; filaments free; anther basifixed, 4-loculed. Ovary 3-loculed. Stigmas 3. Capsule smooth, 3-valved.

Four species: Cambodia, China, India, Laos, Sri Lanka, Thailand; one species (endemic) in China.

川藻 chuan zao

Roots pink to purple, sometimes yellowish green, flattened, 1–1.5 mm wide. Stems 7–9 mm tall, with 5–10 leaves. Leaf blade elliptic, 0.5–1 × 0.4–0.5 mm. Bracts ovate, concave, ca. 1 mm. Tepals purple, ca. 2.5 mm. Stamens 1–2.5 mm. Ovary ellipsoid, ca. 0.7 mm. Stigma ± triangular. Capsule ellipsoid, ca. 1.5 mm; pedicel ca. 1 mm. Seeds ovoid, ca. 0.2 mm. Fl. and fr. Nov–Dec.

Fujian.

2. HYDROBRYUM Endlicher, Gen. Pl. 1375. 1841.

水石衣属  shui shi yi shu

水石衣 shui shi yi

Small herb. Roots green, many branched, ca. 2.5 cm in diam., leathery when dry. Stems short, with 4–6 leaves. Sterile stem leaves in a rosette, linear, 3–4 mm; leaf blade 1–2 mm. Spatheca ca. 2.5 mm. Tepals 2, linear, membranous, ca. 1.5 mm. Stamens 2, filaments connate to middle, ca. 1.5 mm; another ca. 0.3 mm. Ovary ellipsoid, ca. 2 mm. Stigmas bluntly...
PODOSTEMACEAE

川苔草属 chuan tai cao shu

Lawiella Koidzumi.

Herbs, perennial. Roots flat, cylindric to flattened, branched. Stems arising laterally from root margins, simple. Sterile stem leaves in a rosette, simple or digitate, with 3–9 segments. Fertile stems to 1 cm tall; leaves densely imbricate, digitate. Flowers solitary, terminal, zygomorphic, pedicellate, enclosed in spathella before anthesis; spathella ovoid, apex nipple-shaped, usually irregularly dehiscent, sometimes by a lateral slit. Tepals 2, at both sides of filament base, narrowly triangular to linear, membranous. Stamen 1, rarely 2, filament curved, anther basifixated, 2-loculed. Ovary 2-loculed. Stigmas 2. Capsule smooth, 2-valved; largest valve persistent.

Five species: E and SE Asia; two species (one endemic) in China.

1a. Flowering stem 5–6 mm tall; stigmas linear ......................................................... 1. Cladopus nymanii
1b. Flowering stem 3–4 mm tall; stigmas rhombic .................................................... 2. Cladopus chinensis

飞瀑草 fei pu cao

Cladopus fukienensis (H. C. Chao) H. C. Chao; Lawiella fukienensis H. C. Chao.

Roots dark green, usually turning reddish, flattened, 1–3 mm wide. Leaves on sterile stems simple or digitate with linear segments, 2–4 mm. Fertile stems 5–6 mm tall; leaves with 3–7(–9) segments, 1–2 × 1–3 mm. Spathella ca. 2 mm, irregularly dehiscent. Tepals linear, ca. 1 mm. Stamen 1 or 2; filament ca. 1.8 mm, basally united when 2; anther elliptic, ca. 1 mm. Ovary obovoid to ± globose, ca. 1.5 mm. Stigma linear, 0.5–0.7 mm. Capsule ± globose, 1.5–2 mm; stipe 1.5–3 mm. Fl. and fr. Sep–Feb.

Swift-running streams and cascades, clinging to rocks; near sea level to 600 m. Fujian, Guangdong, Hainan [Indonesia, S Japan, Thailand].

川苔草 chuan tai cao

Roots dark green to yellowish green, flattened, 1–3 mm wide. Leaves on sterile stems linear, 3–3.5 mm. Fertile stems 3–4 mm tall; leaves with 6–9 segments, 1–2 × 1–3 mm. Spathella ca. 2 mm, apically and transversely dehiscent. Tepals linear, ca. 0.8 mm. Stamens 1 or 2; filaments 0.8–1.3 mm, basally united when 2; anther ovoid to globose, ca. 0.5 mm. Ovary ± globose, 1–1.5 mm. Stigma rhombic, ca. 0.5 mm. Capsule ± globose 1–2 mm; stipe 1.5–2.5 mm. Fl. Sep–Dec, fr. Jan–Mar.

● 200–400 m. Fujian, E Guangdong.
