ARACEAE

天南星科  tian nan xing ke

Li Heng (李恒 Li Hen), Zhu Guanghua (朱光华), Peter C. Boyce, Jin Murata, Wilbert L. A. Hetterscheid, Josef Bogner, Niels Jacobsen

Herbs, perennial, of diverse habit including climbers, floating aquatics, helophytes, pachycaul shrubs, and geophytes. Underground stems absent, or present and then rhizomatous or tuberous; aerial stems variously produced or not, often evergreen; bulbils for vegetative reproduction sometimes produced, e.g., on leaf or on special shoots. Leaves alternate or apparently basal, usually ground stems absent, or present and then rhizomatous or tuberous; aerial stems variously produced or not, often evergreen; bulbils petiolate with sheathing bases, often subtended by prophylls and/or cataphylls; leaf blade various, e.g., linear, simple (base often cordate to sagittate), sometimes peltate or variously compound (e.g., pinnate, radiate, pedate, or decompound), or still more complex and “dracontoid” (elaborate forms of sagittate, hastate, or trisect leaves in which anterior and posterior divisions are highly dissected and subdivided). Inflorescences (sometimes precocious) subtended by membranous prophylls and/or cataphylls, consisting of a spadix subtended by a spathe. Spathe commonly with tubelike base (margins fused or not) persistent or with deciduous blade. Spadix bearing bisexual or unisexual flowers, in latter case plants paradoecious or monoecious (spadix female proximally and male distally), very rarely with morphologically bisexual but functionally unisexual flowers. Bisexual flowers: tepals 0, 4, or 6; stamens 4–6–22, filaments free, anthers with 2 thecae; ovary usually 3-lobed or more loculed or 1-loculed (pseudomonomorous). Unisexual flowers almost always naked [rare exceptions (only 3 genera, these all from Africa, including cultivated Zamioculcas with tepalate flowers)]; male represented by 1–6 (usually 2–4) free stamens or 2–12 (rarely up to 32) stamens contamnate into a synandrium overtopped by a common synnchonecous, anthers often subcapsule, usually deshiching apically by pores or slits (straight or horseshoeshaped); female flowers consisting of a single ovary (sometimes associated with a sterile staminate), commonly 1-loculed (sometimes with 3 or 4 locules), ovules 1 to many per locule, placentation parietal, axile, basal, or apical. Pollen grains aperturate or inaperturate, exine of various ornamentation. Most genera (Aroideae s.l.) with inaperturate pollen grains without sporopollenin. Sterile (neuter) flowers derived from male or female flowers sometimes present at apex or base of female and/or male zones of spadix. Spadix sometimes with a sterile, terminal appendix. Fruit usually a head of 1- to several-seeded indehiscent separate berries, or dehiscent via shedding stylar plate (Monstereae excluding Amydrium) or syncarpous and apically dehiscent (Cryptocoryne) or syncarpous and indehiscent (Syngonium, cultivated), commonly red, green, white, or yellow, rarely blue.

About 110 genera and more than 3,500 species: all parts of the world except polar regions and the driest deserts, chiefly in tropical and subtropical regions; 26 genera and 181 species (72 endemic) in China.

There is an abundance of Araceae in the S and SW provinces of China. The NE and NW regions are poorer. About 50% of Araceae species in China are medicinal plants; for example, Arisaema heterophyllum, Pinellia pedatisecta, and P. ternata have been used since ancient times. Tubers of Amorphophallus and Colocasia are used for food or in industry for starch. Pistia is very valuable as feed for pigs and sometimes is cultivated as an ornamental plant in aquatic gardens.

The following genera are not native to China but are cultivated there: Acalypha Schott, Anthurium Schott, Caladium Stventenat, Dieffenbachia Schott, Monstera Adanson, Philodendron Schott, Spathiphyllum Schott, Syngonium Schott, Zamioculcas Schott, and Zantedeschia Sprengel.

1. Flowers bisexual.
2. Flowers with perianth (“perigone”).
   3. Plants climbing.
      4a. Ovary 3-loculed (but fruit monomorous); flowers functionally bisexual ................................................. 2. Pothos
      4b. Ovary 1-loculed; flowers functionally unisexual (plants dioecious) ........................................................ 3. Pothoidium
   3b. Plants herbaceous, not climbing.
      5a. Plants without prickles (unarmored); leaves deciduous, oblong-cordate; inflorescences carried at ground level with most of peduncle hypogeeal; plants of boreal habitats ............................................. 1. Symplocarpus
      5b. Plants armored with prickles; leaves evergreen, sagittate or hastate to pinnatifid or pinnatifidate; inflorescence carried on an erect, aerial peduncle; plants of tropical habitats ................................................. 9. Lasia
2b. Flowers without perianth (“perigone”) or reduced and not visible from above.

6a. Plants aquatic and/or helophytic; spathe persistent; fruit red; plants of boreal habitats .............................. 10. Calla
6b. Plants climbing, not aquatic and/or helophytic; spathe deciduous; fruit various, if red then spathe caducous; plants of tropical habitats.
7a. Fruit each a discrete indehiscent berry.
   8a. Inflorescences solitary or at most 3 held loosely together; flowers without perigone; fruit ovoid, white at maturity .................................................................................................................. 5. Amydrium
   8b. Inflorescences several together distichously arranged; flowers with reduced inconspicuous perigone; fruit truncate, red at maturity .................................................. 4. Anadendrum
7b. Fruit not a discrete berry, dehiscent via shedding of stylar plate.
   9a. Fruit each with numerous small, straight seeds .............................................................................. 6. Rhaphidophora
   9b. Fruit each with 1 to few large, curved seeds.
      10a. Seeds 2–4 per fruit on an intrusive parietal placenta; leaves pinnately divided with pinholes along midrib ................................................................. 7. Epipremnum
      10b. Seed 1 per fruit on a basal placenta; leaves always entire ..................................................... 8. Scindapsus
11a. Plant a free-floating aquatic ........................................................................................................ 26. Pistia
11b. Plant never a free-floating aquatic, if aquatic then rooted in soil.
12a. Suffruticose herbs; fruit a red berry ...................................................................................... 15. Aglaonema
12b. Herbaceous plants of various life forms but never suffruticose; fruit various.
   13a. Rooted aquatics; female flowers connate; fruit an apically dehiscent syncarpium .......... 13. Cryptocoryne
   13b. Terrestrial herbs and/or geophytes; female flowers free; fruit separate, indehiscent.
   14a. Stamens of each male flower entirely connate into distinct synandrium.
   15a. Spatha not differentiated into a distal limb and proximal tube.
      16a. Spatha brightly colored (inside commonly yellow or purple-red); female flowers with staminodes (staminodes absent in S. griffithii); stem a repent or suberect epigean rhizome .......................................................... 22. Steudnera
      16b. Spatha white; female flowers without staminodes; stem a hypogean tuber or stolon ......................................... 14. Hapaline
   15b. Spatha differentiated into a distal limb and proximal tube separated by a pronounced constriction.
      17a. Plant with conspicuous erect aerial stolons bearing numerous barbed bulbils .... 23. Remusatia
      17b. Plant without conspicuous erect aerial stolons, if stolons present then these decumbent and bearing tubercles at tips.
         18a. Mature infructescences declined to pendent; placenta parietal; fruit < 3 mm (to 5 mm in C. gigantea), pale yellow to brown and fruit-smelling when ripe; seeds small, very numerous per fruit ....................... 24. Colocasia
         18b. Mature infructescences erect; placenta basal; fruit > 4 mm, red when ripe, odorless; seeds large, few per fruit .................................................. 25. Alocasia
   14b. Stamens of each male flower free, or only filaments connate (rarely also anthers fused in Arisaema).
      19a. Spadix appendix absent (spadix fertile to apex), or if present then usually consisting of clearly defined subglobose sterile (neuter) flowers.
      20a. Spatha wholly persistent into fruiting, splitting from base to apex at fruit maturity; spathe free from spadix; spadix appendix absent; vegetative tissues aromatic (terpenoids) when crushed .................................................. 11. Homalomena
      20b. Spatha limb deciduous during anthesis, proximal spathe persisting to fruiting and then splitting from apex to base at fruit maturity; much of female zone of spadix adnate to spathe; spadix appendix present; vegetative tissues not aromatic ................................................................. 12. Schismatoglottis
      19b. Spadix appendix present, ± smooth to rugulose, hairy or echinate, without subglobose sterile (neuter) flowers, or if such sterile flowers present then usually confined to proximal part or base.
      21a. Spadix unisexual, or if bisexual then male and female zones contiguous or separated by sterile zone usually covered with staminodes.
         22a. Leaves variously divided (most commonly pedate to pedatisect but not decompound), very rarely entire; berries ripening reddish .................. 21. Arisaema
         22b. Leaves commonly solitary, usually decompound, very rarely pedate, never entire; berries ripening red or blue .......................... 16. Amorphophallus
      21b. Spadix bisexual, male and female zones separated by naked sterile axis (interstice).
23a. Female zone of spadix adnate to spathe ........................................................... 20. *Pinellia*
23b. Female zone of spadix free.

24a. Appendix with a whorl of prominent staminodes directly above male zone; placation parietal ............................................................... 17. *Arum*
24b. Appendix with a stipelike smooth part below base or contiguous with male zone, whorl of staminodes absent above male zone; placation basal.

25a. Sterile zone between female and male zones with smooth naked distal part, base with various numbers of staminodes or whole zone covered with staminodes but then leaves always entire and proximal staminodes spatulate (in *T. flagelliforme*) ................................................................. 18. *Typhonium*
25b. Sterile zone between female and male zones fully covered with staminodes, or grooved and with staminodes only at base; leaves usually pedate, rarely entire (in *S. giganteum*); staminodes never spatulate ..................................................... 19. *Sauromatum*

臭菘属  chou song shu

Li Heng (李恒 Li Hen); Peter C. Boyce, Josef Bogner

*Symplocarpus* Bigelow; *Spathyema* Rafinesque.

Herbs, large, glabrous, seasonally dormant. Rhizome erect, stout, with thick roots. Leaves few to several petiolate; petiole long, with sheath; leaf blade subcordate to cordate-ovate, large, apex acute to cuspidate; midvein strong, primary lateral veins pinnate and arching toward apex, running into inconspicuous marginal vein, secondary lateral veins and higher order venation reticulate to transversely reticulate. Inflorescences 1 or 2 in a sympodium, appearing before or with leaves; peduncle long but only shortly exserted above ground; cataphylls surrounding peduncle. Spathe convolute at base, somewhat to widely gaping at apex, thick, boat-shaped or conchiform, apex 2-keeled, rostrate, curving forward. Spadix stipitate, globose to broadly ellipsoid, much shorter than spathe and hidden within. Flowers bisexual, with perigone; tepals 4, arching and imbricate. Stamens 4, free; filaments flattened; connective slender; thecae oblong, dehiscing by longitudinal slit; pollen grains ellipsoid, monosulcate, exine reticulate, apertural exine verrucate. Ovary of gynoecium (pistil) somewhat immersed in spadix axis, 1-loculed; ovule 1, orthotropous; funicle very short; placation apical-parietal; stylar region long attenuate; stigma punctate-disciform. Infructescence globose to broadly ellipsoid, berries densely arranged. Berry with tepals and style persistent to ripe fruiting stage, base of berry immersed in spongy spadix axis. Seed globose; testa thin, smooth; embryo globose, large; endosperm very sparse, only a single cell layer thick. 2n = 30, 60.

Four or five species: E Asia, North America; two species in China.

The other species in the genus are *Symplrocarpus foetidus* (Linnaeus) Salisbury ex W. P. C. Barton (the type species) in North America; *S. egorovi* N. S. Pavlova & V. A. Nechaev in Russia (Far East), and *S. nabekuraensis* Otsuka & K. Inoue in Japan, but the latter is very close to *S. renifolius* and is better considered as an infraspecific taxon of it.

1a. Leaf blade orbicular-cordate, 30–40 cm long and wide or nearly so; flowering before leaves appear in early spring; fruit ripening in summer of same year .............................................................................................................. 1. *S. renifolius*
1b. Leaf blade ovate to ovate-oblong, 10–20 × 7–12 cm; flowering with leaf appearance in summer (ca. Jul); fruit ripening in spring of following year .............................................................................................................. 2. *S. nipponicus*

臭菘  chou song

Rhizome hypogeous, to 7 cm in diam. Leaves in a rosette; petiole to 40 × ca. 1 cm; leaf blade orbicular-cordate, 30–40 cm long and wide or nearly so (to 33 cm wide), mid-green, base cordate, apex acute; venation reticulate, midvein very strong, primary veins 5 on each side, ascending toward apex, lowermost ones running into basal lobes. Flowering before leaves appear; inflorescence usually solitary; peduncle green and purplish tinged, 7–13(–20) × ca. 1 cm. Spathe plain purple to blackish purple, rarely green without any markings or with dark purple spots, boat-shaped, 8–20 × 5–12 cm, strongly leathery, apex acuminate. Spadix ellipsoid, 2–2.5 × ca. 1.2 cm. Flowers densely arranged. Flower 3–3.5 mm in diam., tepals pinkish, thecae yellow. Fl. early spring, fr. summer of same year.

Wet places, forest swamps, moist mixed and coniferous forests, swampy meadows and lands; below 300 m. Heilongjiang [Japan, Russia (Far East)].
The plant is poisonous but sometimes is used medicinally to treat swelling.

日本臭菘 ri ben chou song

Rhzomie hypogeous, thinner. Leaves in a rosette; petiole to 20 cm; leaf blade green, rarely variegated, ovate to narrowly ovate-oblong, 10–20 × 7–12 cm, base obtuse to cordate-subcordate, apex acute; venation reticulate, midvein strong, primary lateral veins 6 or 7 on each side. Flowering with leaf appearance; peduncle purple, long. Spathae plain purple or mottled dark purple, broadly elliptic and boat-shaped, leathery. Spadix ellipsoidal, stipitate. Flowers densely arranged. Fl. summer (ca. Jul), fr. spring of following year.

Wet places; below 300 m. Heilongjiang [Japan, Korea].

2. **POTHE Linnaeus, Sp. Pl. 2: 968. 1753.**

*Tapanava* Adanson.

Plants climbing against trees with aid of adhesive roots, or creeping over rocks. Primary shoots branching to produce further adherent shoots and both types (in most species) sterile but giving rise to free, sympodial or physiognomically monopodial flowering shoots, often highly ramified, arising from leaf axil (subg. *Pothos*) or beneath it [subg. *Allopothos*]. Leaves simple, distichous; petiole conspicuously winged [or wingless]; petiolar sheath minute or well developed, amplexicaul; articulation distinct (pulvinus at junction of petiole and blade); leaf blade with primary lateral veins on each side of midrib traversed by 1 or more intramarginal veins running ± from base and from ca. midway along midrib to apex or first to distal margins and then to apex. Inflorescences in axils of leaves or seemingly extra-axillary, sometimes pseudoterminal, usually several along stem; peduncle partly or entirely enveloped by sheathlike organs (cataphylls). Spathe inconspicuous, cymbiform or elongate, not constricted, at last entirely spreading, and either spreading or recurved. Spadix sessile or stipitate, varying in shape, with reduced flowers at very base, otherwise fertile. Flowers many, bisexual, sometimes reduced; tepals 6, with vaulted-truncate apex. Stamens 6; filaments strap-shaped; anthers ovoid, longitudinally dehiscent. Ovary 3-loculed; ovule 1 per locule, subbasal; stigma sessile, initially umbilicate. Berry 1–3-seeded. Seeds large, without endosperm.

About 75 species: tropical and subtropical regions of Asia, Australia, Madagascar, and Polynesia; five species in China.

1a. Petiole 13–15 cm, much longer than leaf blade, leaf blade 3–4 cm; spadix cylindric, 5–6 × 0.15–0.2 cm .......................... 5. *P. repens*

1b. Petiole shorter than or as long as leaf blade; spadix cylindric to globose.

2a. Petiole nearly as long as to slightly exceeding blade.

3a. Peduncle at anthesis reflexed or recurved; spadix subglobose or ellipsoid, 5–6 mm ................................. 1. *P. scandens*

3b. Peduncle erect; spadix cylindric, ellipsoid, ovoid, or subglobose, 4–25 mm ................................. 2. *P. chinensis*

2b. Petiole much shorter than leaf blade.

4a. Petiole narrow and long, obovate-oblong or cuneate; veins inconspicuous; branchlets not 4-angled .......... 2. *P. chinensis*

4b. Petiole broad, small, obovate, length and width only 1/8–1/6 of blade; veins conspicuously branched; branchlets 4-angled.

5a. Peduncle and stipe short and broad, together 1.3–2 cm; peduncle stout .............................................. 3. *P. pilifer*

5b. Peduncle and stipe long and narrow, together 7.5–8 cm; peduncle very slender .......................... 4. *P. kerrii*

1. **Pothos scandens** Linnaeus, Sp. Pl. 2: 968. 1753.

螳螂跌打 tang lang die da

*Batis hermaphroditia* Blanco; *Podospadix angustifolia* Rafinesque; *Pothos angustifolius* (Rafinesque) C. Presl; *P. changelieri* Schott; *P. cognatus* Schott; *P. decipiens* Schott; *P. exiguiflorus* Schott; *P. fallax* Schott; *P. hermaphroditus* (Blanco) Merrill; *P. hirsfriedii* Miquel; *P. leptospadix* de Vriese; *P. longifolius* C. Presl; *P. longipedunculatus* Engler, nom. illeg. superfl.; *P. microphyllus* C. Presl; *P. roxburghii* de Vriese; *P. scandens* var. *cognatus* (Schott) Engler; *P. scandens* var. *hermaphroditus* Engler; *P. scandens* var. *sumatrana* de Vriese; *P. scandens* var. *zeyanicus* de Vriese; *P. scandens* var. *zollingerianus* (Schott) Engler; *P. zollingerianus* Schott; *Tapanava indica* Rafinesque; *T. rheedi* Hasskarl.

Lianas, medium sized to rather large, to 6 m. Stems weakly 4-angled or suberete, to 10 mm in diam. Leaves paler abaxially, bright to deep green adaxially; petiole obovate-oblong to linear-oblong, 20–140 × 5–20 mm, broadly winged, base decurrent, apex truncate, rounded, or auriculate; each side with 2 or 3 secondary veins and numerous veinlets; leaf blade ovate to elliptic or lanceolate, 2–10 × 3–14 cm, base rounded to acute, apex attenuate-mucronate; each side with 2 intramarginal veins arising from base and either reaching leaf tip or merging into a prominent submarginal collecting vein, all additional veins arising obliquely from midrib. Flowering shoot much abbreviated, arising from most of mid- to distal leaf axils of fertile shoots, bearing a minute prophyll and a few cataphylls 3–10 mm, sequentially longer. Inflorescence solitary; peduncle erect to spreading, green to purple tinged, 3–15 × 0.5–2 mm, slender. Spathe greenish to maroon, ovate, concave, 4–8 × 4–7 mm, base short or somewhat long clawed, margins variously in-
rolled, apex rounded to acute with a tiny, rather stout mucro. Spadix stipitate; stipe erect, bright green to maroon, terete in cross section, 5–10 × ca. 1 mm, distally erect to bent through 270°; fertile zone yellow-green to off-white, globose or ovoid to subclavate, 4–10 × 3.5–10 mm. Flowers 1–2 mm in diam. Infructescence with 1–5 berries. Fruit mid-green, ripening to deep scarlet, oblanceolate, 10–17.5 × 10–14 mm. Fl. and fr. throughout year.

Rain forests, monsoon rain forests, mountain or river terraces, creeping on trees or on rocks; 200–1000 m. SE Xizang (Mêdøg), S and SE Yunnan [Bangladesh, Brunei, Cambodia, India, Indonesia, Laos, Malaysia, Myanmar, ?Nepal, Philippines, ?Singapore, Sri Lanka, Thailand, Vietnam; Indian Ocean islands (Comoros), Madagascar].

This plant is used medicinally in Yunnan for treating traumatic injuries and rheumatic arthralgia. The leaves are used as tea by the Dai ethnic minority.

石柑子 shi gan zi

*Tapanaea chinensis* Rafinesque, Fl. Tellur. 4: 14. 1838; *Pothos balansae* Engl. *; P. cathcartii* Schott; *P. chinensis* var. *lotiensensis* C. Y. Wu & H. Li; *P. seemannii* Schott; *P. warburgii* Engl; *P. yunnanensis* Engl.

Lianas, small to very large, to 10 m, root-climbing. Stem weakly 4-angled or terete in cross section, to 12 mm in diam. Leaves paler abaxially, bright to mid-green adaxially; petiole obovate-oblong to linear-oblong or narrowly triangular, 50–140 × 4–20 mm, broadly winged, base decurrent to clawed, apex truncated, rounded, or auriculate; each side with 2 or 3 secondary veins and numerous veinlets; leaf blade ovate to elliptic or lanceolate, 3–20.5 × 1.5–20.5 cm, apex attenuate-mucronate to acute or attenuate, minutely tubulate; each side with 2–4 intramarginal veins arising from base and either immediately diverging or remaining very close and parallel to midrib and then diverging further along leaf blade, submarginal collecting vein prominent. Flowering shoot much abbreviated, arising from most of mid- to distal leaf axils of fertile shoots. Inflorescence solitary; peduncle erect, green, stout, 0–3(–5) × ca. 1 mm. Spathe green to greenish purple, ovate, concave, 4–5 × 2.5–4 mm, base decurrent on peduncle, margins strongly inrolled, apex arched to recurved, acute. Spadix stipitate; stipe erect, straight to slightly curved, green to greenish purple, terete, stout, 10–12 × 1–1.25 mm; fertile zone yellow, globose, 4–5 × 4–5 mm. Flowers 1–2 mm in diam. Infructescence not seen. Fl. Dec–Jul.

Dense forests, on rocks; 200–1000 m. SW Guangxi, SE Yunnan [N Vietnam].

The name *Pothos pilulifer* was first published by Gagnepain (in Lecomte et al., Fl. Indo-Chine 6: 1084. 1942) but not validly so because no Latin description or diagnosis was provided (*Vienna Code*, Art. 36.1).

All parts of the plant are used medicinally for treating epilepsy.

Lianas, medium sized, to 4 m, root-climbing. Stems terete in cross section, to 6 mm in diam. Leaves when fresh mid-green; petiole oblong to oblong-triangular, 10–30(–50) × 5–10 mm, broadly winged, base decurrent to clawed, apex truncate to auriculate; each side with 2–4 secondary veins, veins prominent, especially in dried material; leaf blade lanceolate to narrowly elliptic, 7.5–13 × 1.25–2.5 cm, base rounded, apex long attenuate-mucronate to acute, minutely tubulate; each side with

Dense forests, moist mountain valleys, climbing on trees or creeping over rocks; below 2400 m. Guangdong, Guangxi, Guizhou, Hainan, Hubei, Hunan, Sichuan, Taiwan, SE Xizang (Mêdøg), Yunnan [Bangladesh, Bhutan, Cambodia, India, Laos, Myanmar, Nepal, Thailand, Vietnam].

*Pothos balansae*, *P. cathcartii*, *P. chinensis*, and *P. warburgii* are without doubt synonymous. They might be separable when only a few specimens of each entity are studied, but when a wide range of material is used the four merge together as one species, for which the earliest name is *P. chinensis*. See Boyce (Blumea 45: 147–204. 2000).

The whole plant is used medicinally to treat rheumatic arthralgia, traumatic injuries, fractures, coughs, and infantile malnutrition caused by intestinal parasites.

地柑 di gan

Lianas, medium sized to large, to 5 m, root-climbing. Stems rectangular in cross section, ± compressed, to 12 mm in diam., angles minutely but prominently winged. Leaves paler abaxially, when fresh mid-green adaxially; petiole obovate-oblong to linear-oblong or narrowly triangular, 10–40 × 4–17 mm, somewhat narrowly to rather broadly winged, base decurrent, apex truncate, rounded, or auriculate; each side with 2–4 secondary veins and numerous veinlets, all veins, but particularly secondary veins, prominent; leaf blade ovate to elliptic or lanceolate, 3.5–11 × 2–5 cm, base rounded to subacute, apex attenuate, somewhat prominently tubulate; each side with 2–4 intramarginal veins arising from base and either immediately diverging or remaining very close and parallel to midrib and then diverging further along leaf blade, either reaching leaf tip or merging into a prominent submarginal collecting vein, additional veins arising obliquely from midrib, remaining parallel. Flowering shoot much abbreviated, arising mostly from upper-middle to distal leaf axils of fertile shoots. Inflorescence solitary; peduncle erect, green, stout, 0–3(–5) × ca. 1 mm. Spathe green to greenish purple, ovate, concave, 4–5 × 2.5–4 mm, base decurrent on peduncle, margins strongly inrolled, apex arched to recurved, acute. Spadix stipitate; stipe erect, straight to slightly curved, green to greenish purple, terete, stout, 10–12 × 1–1.25 mm; fertile zone yellow, globose, 4–5 × 4–5 mm. Flowers 1–2 mm in diam. Infructescence not seen. Fl. Dec–Jul.

Dense forests, on rocks; 200–1000 m. SW Guangxi, SE Yunnan [N Vietnam].

The name *Pothos pilulifer* was first published by Gagnepain (in Lecomte et al., Fl. Indo-Chine 6: 1084. 1942) but not validly so because no Latin description or diagnosis was provided (*Vienna Code*, Art. 36.1).

All parts of the plant are used medicinally for treating epilepsy.
2 or 3 intramarginal veins arising from base and immediately diverging and reaching leaf tip. Flowering shoot much abbreviated, arising from middle to distal leaf axis of fertile shoots, bearing a minute prophyll and few cataphylls 3–10 mm, sequentially longer. Inflorescence solitary; peduncle erect to spreading, curving to bring inflorescence upright, deep purple, very long and slender, 25–40 × 0.5–1 mm. Spathe greenish purple, ovate, deeply concave to almost flat, 4–6 × 3.5–7 mm, base prominently coriaceous, clasping and minutely decurrent on peduncle, margins straight, aper obute with a small but prominent nucro. Spadix stipitate; stipe erect, straight, deep purple, terete in cross section, 10–18 × 0.23–0.75 mm; fertile zone pale yellow, globose, 3.5–4 × 3.5–4.5 mm. Flowers 1–2 mm in diam. Infructescence with 1–7 berries. Fruit obclavate to ellipsoid, 10–15 × 7.5–10 mm. Fl. Aug.

Dense forests, on rocks. SE Guangxi (Longzhou) [Laos, Vietnam].

The name *Pothos kerrii* was first published by Gagnepain (in Lecomte et al., Fl. Indo-Chine 6: 1085. 1942) but not validly so because no Latin description or diagnosis was provided (Vienna Code, Art. 36.1).

*Pothos kerrii* is quite similar to *P. pilulifer*, but it differs by the elongated peduncle and stipe (7.5–8 cm together vs. 1.3–2 cm together in *P. pilulifer*).

The plant is used medicinally to treat traumatic injuries.

百足藤 百足藤

*Flagellaria repens* Loureiro, Fl. Cochinch. 1: 212. 1790; *Pothos loureiroi* Hooker & Arnott; *P. terminalis* Hance.

Lianas, medium sized to very large, to 15 m, root-climbing. Stems weakly 4-angled or slightly compressed terete in cross section, to 20 mm in diam. Leaves paler abaxially, bright to deep green adaxially; petiole oblong-ovoblate-lanceolate to linear-oblanceolate, 50–200 × 5–25 mm, broadly winged, base decurrent, apex truncate, slightly auriculate; each side with 2 or 3 barely differentiated primary veins running parallel to midrib and numerous parallel to subparallel and reticulate veinlets, primary and larger secondary veins reaching petiole tip and there curving inward to merge with leaf blade/petiole junction; leaf blade ovate to elliptic or triangular-lanceolate, 20–80 × 10–20 mm, base rounded to truncate, apex subacute to acute, briefly tubular-mucronate; primary veins 3(–5), ± parallel, arising from base reaching tip of leaf blade. Inflorescences solitary to several together, congested or spaced along a leafy to naked branching system to 2 m; peduncle curving to spreading, slender, 3–8 × 0.5–2 mm; terminal part erect, green. Spathe strongly reflexed at anthesis, greenish with margins stained purple, narrowly elliptic, 20–70 × 3–6 mm, margins recurved to reflexed, base briefly decurrent, apex apiculate to shortly filiform. Spadix stipitate; stipe erect, greenish to purple, terete in cross section, 10–13 × 1–1.2 mm; fertile zone yellow-green to off-white, narrowly cylindric, 40–80 × 2–4 mm, sometimes strongly obliquely inserted on stipe. Flowers 1–2 mm in diam. Infructescence with few berries. Fruit turbiniform to ellipsoid, globose at maturity, 7–15 × 10–14 mm. Fl. Mar–Apr, fr. May–Jul.

 Moist forests, climbing on trees or creeping over rocks; below 900 m. S Guangdong, S Guangxi, Hainan, S Yunnan [Laos, N Vietnam].

This plant is used for treating traumatic injuries, fractures, and abscesses.

假石柑属 假石柑

Li Heng 王恒 Li Hen; Peter C. Boyce

Shrubs, climbing. Branches extra-axillary. Leaves simple, distichous, petiolate; petiole elongated, leaflike, flattened, veins parallel; leaf blade triangular-lanceolate, short, with parallel veins. Inflorescences in axil of leaves; bractlike cataphylls 1 or 2. Spathe deciduous, short. Spadix cylindric. Flowers bisexual but plants functionally dioecious; tepals 6, with vaulted-truncate apex; stamens 3–6, anthers oval, longitudinally dehiscent; ovary obovoid, 1-loculed, ovule solitary, subbasal, stigma sessile. Berry ovoid, acute. Seed oblong, without endosperm.

One species: China (Taiwan), Indonesia (Maluku, Sulawesi), Philippines.

*Pothoidium* is similar to *Pothos repens* but differs in being functionally dioecious, by the branching inflorescences, and by its unilocular ovary and solitary ovule. *Pothoidium* has functionally unisexual spadices arranged seemingly in panicles and maturing sequentially. The structure of the fertile shoots is not yet clearly understood; however, it is possible that they are developed by the reduction of all the leaves of a leafy fertile shoot system to minute prophylls and cataphylls and that the panicle-like synflorescence is hence to be regarded as an aggregate structure. *Pothos repens* and *Pothoidium* are vegetatively almost identical. Depauperate flowering specimens of *Pothoidium* greatly resemble robust plants of *Pothos repens*. Interpretation of *Pothoidium* inflorescences suggests that *P. lobbianum* is functionally dioecious. “Male” spadices have flowers with prominently visible anthers and an apparently sterile ovary. “Female” spadices have flowers with a large unilocular fertile ovary and no stamens. Flowers of *Pothos* species are always bisexual with a 3-locular ovary.

1. **Pothoidium lobbianum** Schott, Oesterr. Bot. Wochenbl. 7: 70. 1857.

假石柑 假石柑
several to many, borne in a terminal branching system, proximal inflorescences axillary to a foliage leaf, distal ones either subtended by a cataphyll or without a subtending leaf, peduncular axis slender, consisting of 1 to several internodes, sometimes subtended by a prophyll, sometimes also bearing a cataphyll halfway up. Spathe occurrence irregular, often absent, widely spreading, linear-lanceolate or broadly ovate, 5–7.5 mm, margins usually revolute, apex acute. Spadix apparently often functionally unisexual, cylindric, 1.5–2.5 cm, sessile to long stipitate when subtended by spathe. Flowers apparently usually unisexual, sometimes bisexual, congested, with a perigone of 6 free tepals; male flowers with well-developed anthers and apparently sterile ovary, stamens 3–6, free, number often varying on a single spadix; female flowers with large fertile ovary and lacking stamens. Berry ca. 1.2 cm × 6 mm. Seed solitary, ovoid.

S Taiwan (Lan Yu) [Indonesia (Maluku, Sulawesi), Philippines].

4. **ANADENDRUM** Schott, Bonplandia (Hannover) 5: 45. 1857.

*上树南星属*  shang shu nan xing shu

Li Heng (李恒 Li Hen); Peter C. Boyce

*Notopothos* Kunze.

Plants creeping against trees or over boulders by means of adhesive roots. Leaves distichous, petiolate, undivided, pinnately veined; distal nodes of stem with usually 2 normal leaves with distinct sheaths, and (mostly) several strongly to entirely reduced leaves with strongly developed sheaths; petioles of other leaves only at base moderately sheathing, pulvinus distinct; trichosclereids and laticiferous vessels absent. Inflorescences emerging from a rhipidium carried at shoot tips (or sometimes laterally displaced), with each inflorescence subtended by a reduced leaf comprised mainly of an expanded petiolar sheath. Spathe white or green, cymbiform, oblong-ovate, initially tubular-inrolled and beaked for ca. 1/4 spathe length, at last entirely spreading, often caducous. Spadix cylindric, with stipe well developed. Flowers many, bisexual; perigone a single cuplike structure, membranous, truncate. Stamens 4; filaments strap-shaped; anthers longitudinally dehiscent. Ovary 1-loculed, 1-ovuled; ovule central-basal; stigma sessile, transversely inserted. Berry subglobose, distinctly truncate apically. Seed large.

Nine species: tropical Asia, from India to Malaysia; two species in China.

One of us (Boyce) notes that the names *Anadendrum latifolium* and *A. montanum* are misapplied here. True *A. latifolium* is endemic to Peninsular Malaysia (type from Perak), and the type of *A. montanum* is from Indonesia (Java). In fact, there are three species of *Anadendrum* in China, but all are as yet undescribed. Further work is needed to resolve this situation.

1a. Leaf sheath ca. 10 mm wide; leaf blade ovate-oblong, 25–33 × 10.5–14 cm; inflorescence without linear bracts

ca. 7 cm; spadix stipe 5–8 mm ........................................................................................................... 1. *A. montanum*

1b. Leaf sheath 5–7 mm wide; leaf blade ovate-oblong, 25–33 × 10.5–14 cm; inflorescence without linear bracts;

spadix stipe ca. 2 cm .................................................................................................................................... 2. *A. latifolium*

1. **Anadendrum montanum** Schott, Bonplandia (Hannover) 5: 45. 1857.

*上树南星*  shang shu nan xing

Stem 4–5 mm in diam., internodes elongated, ca. 2.5 cm, distal one much shorter, rooting. Petiole 10–15 cm, sheathing from base to pulvinus, developed sheaths 9–14 × ca. 1 cm, mostly early caducous; leaf blade oblong-lanceolate, 15–20 × 5–8 cm, papery, oblique, base obtuse or subcordate, margin entire, apex acuminate; lateral veins 7 or 8 on each side; secondary veins 2 or 3, reticulate. Inflorescences axillary and terminal from bractlike reduced leaves; bractlike leaves linear, ca. 7 cm, apex acuminate with tail 5–7 mm; peduncle 10–15 cm. Spathe initially fusiform and at last entirely spreading, ovate-lanceolate, apex with a rostrum 10–15 mm. Spadix pale green, ellipsoid, 3–3.5 cm; stipe 5–8 mm. Flowers dense; perigone annular, ca. 1/2 as high as ovary. Filaments 4; anthers ovoid. Ovary obovoid, apex ca. 3 mm in diam.; stigma transversely oblong. Berry ovoid, ca. 8 mm, apex truncate. Fl. and fr. Jun–Oct.

Forests, on trees or rocks; below 500 m. Hainan, SE Yunnan [Indonesia, Laos, Malaysia, Singapore, Thailand, Vietnam].

*宽叶上树南星*  kuan ye shang shu nan xing

Stem 0.4–3 m, 4–5 mm in diam., internodes 1.5–3 cm, rooting. Petiole 11–17 cm, narrowly sheathing; sheaths ca. 2/3 as long as petiole, 5–7 mm wide; leaf blade broadly oblong, 25–33 × 10.5–14 cm, base acute, apex cuspidate-acuminate; lateral veins ca. 12 on each side, strong, spreading, and arched. Inflorescences axillary, without bractlike reduced leaves; peduncle ca. 25 cm. Spathe initially fusiform and at last spreading, lanceolate, 5–6 cm, base angustate, apex acuminate. Spadix cylindric, 3–5.8 cm (Yunnan specimens); stipe to 2 cm. Flowers very closed; perigone annular, ca. 1/2 as high as ovary. Stamens 4; anthers base divaricate, apex dehiscent. Ovary obovoid, apex ca. 3 mm in diam.; stigma transversely linear. Berry yellow-green, drying blackened, ovoid, ca. 10 mm, apex truncate. Fl. Apr–May.

Forests; 100–300 m. SE Yunnan [Malaysia, Vietnam].

雷公连属 **lei gong lian shu**

Li Heng (李恒 Li Hen); Peter C. Boyce

*Epipremnopsis* Engler.

Lianas, creeping against trees and over rocks by aid of adhesive roots. Leaves long petiolate; leaf blade entire and pinnatifid or entire with a series of rather large perforations on either side of midrib; pulvinus distinct; latex absent, trichosclereids sparsely present. Inflorescences mostly solitary at tips of primary or lateral shoots; peduncle initially for greater part enveloped by sheaths, afterward becoming naked, far exserted from remnants of fraying sheaths. Spathe initially tubular-inrolled, finally reflexed and entirely spreading, early caducous. Stipe of spadix short; spadix cylindric. Flowers many, bisexual, naked. Stamens 4, free; filaments strap-shaped; anthers longitudinally dehiscent. Ovary 1-loculed; ovules 2, anatropous; placentation subbasal-parietal; style conic; stigma hemispheric, small. Berry white or orange-red, subglobose, apex truncate to domed. Seed subglobose; testa smooth; embryo curved; endosperm present.

Five species: tropical Asia; two species in China.

1a. Leaf blade entire, unlobed; spadix obovoid, ca. 4 cm, distal part ca. 17 mm in diam.; stigma rounded ........................ 1. *A. sinense*

1b. Leaf blade with oblong perforations; spadix cylindric, ca. 6 × 1.3 cm; stigma oblong ................................. 2. *A. hainanense*

雷公连 **lei gong lian**

Stem slender, 3–5 mm in diam.; internodes 3–5 cm. Petiole elongated, 8–15 cm, base sheathing; leaf blade light green, after drying black-brown, falcate-lanceolate, 13–23 × 5–8 cm, strongly asymmetric, one side usually 2 × as wide as other, base broadly cuneate or subrounded, margin entire, apex acute; lateral veins many, diverging at 30° from midrib, contracted near margin into a marginal vein. Peduncle pale green, ca. 5.5 cm. Spathe initially green, inrolled fusiform, ca. 7 cm, middle part ca. 2.2 cm in diam., finally spreading, yellow-green to yellow, cymbiform, subovate, 8–9 × ca. 11.5 cm. Stipe of spadix 5–10 mm; spadix obovoid, ca. 4 × 1 cm, angustate toward base, apex obtuse. Filaments ca. 4 mm; anthers oblong, ca. 3 mm. Ovary 5- or 6-angular, cylindric, ca. 4 × 5 mm, apex truncate; stigma sessile, nearly circular, 1-loculed, 2-ovuled; ovules subbasal, transversely inserted. Berry green, when mature yellow or red, and bad smelling. Seeds 1 or 2, brown, obovoid-reniform, ca. 2 mm. Fl. Jun–Jul, fr. Jul–Nov.

Evergreen forests, on trees or over rocks; 500–1100 m. Guangxi, Guizhou, Hubei, Hunan, Sichuan, Yunnan [N Vietnam].

The stems and leaves are used for treating traumatic injuries, fractures, and angina pectoris.

穿心藤 **chuang xin teng**

Stem cylindric, 3–4 mm in diam.; internodes 2–3 cm. Petiole 20–30 cm, on juvenile branch only 4–5 cm; sheath reaching base of leaf blade; base amplexicaul, marcescent; leaf blade green, after drying dark brown, ovate-lanceolate or falcate-lanceolate, 13–15 cm on juvenile branch, on mature branch blade large, 28–35 × 9–12 cm, papery, base rounded or subcordate, margin entire, apex abruptly acuminate; lateral veins 5–7 pairs, ascending and arched, each side along midrib with some large and some small perforations; perforations ovate or oblong, 4–6 × 1.5–4 cm, sometimes reaching margin and midrib of leaf blade. Inflorescence solitary; peduncle dark brown when dry, cylindric, 8–10 cm. Spathe yellow-red, broadly cymbiform, 8–5 × 8–9 cm, apex shortly rostrate. Stipe of spadix 8–10 mm; spadix cylindric, ca. 6 × 1.3 cm. Stamens 6, shorter than ovary during female anthesis but filaments extending at male anthesis to bring thecae above pistils; filaments flat; anthers longitudinally dehiscent. Ovary hexagonal-cylindric, ca. 3 × 2.5 cm, apex truncate; stigma sessile, longitudinally oblong, 1-loculed, 2-ovuled; ovules anatropous with short funicle, inserted on lower part of placenta. Fl. Apr (Hainan), Oct (Guangxi).

Dense forests in valleys or by watersides, creeping against trees or over rocks; below 300 m. Guangdong, Guangxi, Hainan, Hunan, Yunnan [N Vietnam].

崖角藤属 **ya jiao teng shu**

Li Heng (李恒 Li Hen); Peter C. Boyce

Lianas, large; raphides numerous on stem and leaf; laticiferous ducts absent. Stems thick, creeping and climbing up trees or over rocks by aid of adhesive roots. Leaves distichous, petiolate; pulvinus short or long; petiole often adaxially grooved or canaliculate, sheath extending to pulvinus; leaf blade entire or divided, or perforate, thinly to rather thickly leathery, pinnately veined. Inflorescences terminal on leafy shoots, solitary or sometimes in a fascicle (synflorescence); as synflorescence develops axis sometimes
reiterating and overtopping synflorescence such that inflorescence cluster is displaced and appears to be produced laterally (here termed “appearing axillary”). Spathe not constricted, initially inrolled and tubular, afterward spreading, firm, mostly early caducous, rarely marcescent. Stalk of spadix short or absent; spadix cylindric. Flowers many, bisexual or sometimes a few male, naked. Stamens 4; anthers much shorter than filaments, dehiscent by a slit. Ovary 1- or incompletely 2-loculed, 2- to many ovuled; ovules basal or parietal, 1- or 2-seriate; style broadly conic; stigma circular to linear, in latter case longitudinally inserted. Fruit with stylar plate sloughing away in groups or singularly to reveal ovary cavity with seeds embedded in pulp, many seeded. Seeds small, oblong to reniform.

About 120 species: tropical Asia, Australia, tropical W Pacific; 12 species (two endemic) in China.

1a. Leaf blade entire.

2a. Leaf blade very large, more than 30 cm wide.

3a. Spadix obovoid-cylindric or ellipsoid, narrowing to base, 4.5–5.5 × 1.5–1.75 cm; inflorescences pendent; innovations puberulent; leaf midrib minutely pubescent abaxially ................................................................. 3. R. hookeri

3b. Spadix cylindric, 18–25 × 2–3 cm; inflorescences erect; innovations glabrous; leaf midrib glabrous ...... 4. R. megaphylla

2b. Leaf blade smaller, usually less than 15 cm wide.

4a. Leaf blade oblong or obliquely oblong, obtuse at base, 15–24 × 5–9 cm .................................................................................................................. 2. R. liukiensis

4b. Leaf blade falcate-lanceolate or falcate-elliptic.

5a. Leaf blade narrowly cuneate at base; spadix green outside; spadix narrowing toward apex ........ 5. R. hongkongensis

5b. Leaf blade rounded at base; spadix orange or pale yellow outside; spadix narrower and longer, cylindric.

6a. Spathe orange on both surfaces, light yellow inside at base, light green outside at center immediately after opening (green color soon disappearing); spadix ca. 2/3 of spathe length; leaf blade thickly papery ........................................................................................................... 1. R. lancifolia

6b. Spathe dull orange outside, dull yellow to dull orange inside; spadix more than 4/5 of spathe length; leaf blade subleathery ................................................................................................................ 6. R. peepla

1b. Leaf blade pinnatifid.

7a. Style conspicuous; leaf blade very large, ovate-oblong, pinnae many, 6 or 7(–15) on each side.

8a. Foliage leaves scattered and interspersed with several (up to 7) cataphyll-bearing nodes; feeding roots corky and smooth; perforations absent, leaf blade 60–70 × 40–50 cm ..................................................... 12. R. decursiva

8b. Leaf arrangement not as above; feeding roots densely scaly; large perforations usually present along midrib, leaf blade 30–55 × 22–36 cm .................................................................................................................................................. 11. R. crassicaulis

7b. Style obscure.

9a. Leaf blade less than 35 × 30 cm, with a few pinnae.

10a. Leaf blade broadly ovate, pinnatisect, ca. 35 × 25–30 cm, pinnae 3 or 4 on each side, sinuses almost reaching midrib; spadix long and thin, 15–18 × ca. 0.5 cm when dry .................................................. 8. R. laichauensis

10b. Leaf blade ovate, pinnatifid, and at least some leaf blades on mature branches entire, 17–25 × 5–12 cm, pinnae 2 or 3 on each side, or only on 1 side and other side entire, sinuses reaching to 2–3 cm from midrib; spadix shorter, 12–13 × 0.8–1 cm .................................................................................. 7. R. luchunensis

9b. Leaf blade longer than 37 cm; pinnae with 3–5 subequal, parallel costae.

11a. Pinnae 2–5 per side; spadix shorter than 9 cm ................................................................................................. 9. R. glauca

11b. Pinnae 6–9 per side; spadix ca. 10 cm .................................................................................................................. 10. R. dalongensis

1. Rhaphidophora lancifolia Schott, Bonplandia (Hannover) 5: 45. 1857.

上树蜈蚣  shang shu wu gong

Lianas. Stem climbing, green, to 20 m or more, 1–2 cm in diam.; internodes 1–2 cm, rooting. Petiole green, sheathing from base to pulvinus, 14–30 cm, base ca. 3 mm in diam., at apex pulvinus incrassate, 1–1.5 cm; leaf blade pale green abaxially, green adaxially, falcate-lanceolate to ovate-oblong, rarely ovate, oblique, 25–40 × 10–13.5 cm, thickly papery, base obliquely rounded, i.e., one side obtuse, other side cuneate, usually one side of blade 7–8 cm wide, other side only 4–5.5 cm wide, margin entire, apex long acuminate; lateral veins 7 or 8 per side, ascending obliquely and arched. Inflorescences terminal on branches; cataphylls membranous, lanceolate, ca. 10 cm, caducous; peduncle green, 7–10 cm, ca. 1 cm in diam., distally recurved. Spathe initially green, inrolled and tubular with a rostrum 2–3 cm, at anthesis spreading, orange on both surfaces, light green outside at center immediately after opening (green color soon disappearing), light yellow inside at base, cymbiform in outline, ca. 12.5 × 10 cm, apex abruptly acuminated, with a long rostrum, after anthesis caducous. Spadix sessile, cylindric, ca. 7 × 1.3 cm, apex obtuse. Flowers bisexual, perigone absent. Anthers purple. Ovary yellow or pale green, tetragonal or pentagonal-cylindric; stigma sessile, longitudinally oblong, many ovuled. Infrarescence incrassate, ca. 9 × 1.5–2 cm. Berry gray-green. Seeds many, yellow, cylindric, 1.5–2 mm. Fl. Oct–Nov, fr. following Oct.

Rain forests, monsoon rain forests, creeping on trees; 500–2500 m. W Guangxi, Yunnan [Bangladesh, NE India].

针房藤  zhen fang teng
Lianas. Leaves petiolate; leaf blade oblong or obliquely oblong, 15–24 × 5–9 cm, leathery, base obtuse, margin entire, apex acuminate; lateral veins 8 or 9 pairs, ascending, nearly parallel. Peduncles 6–9 cm. Spathe convolute, ca. 8 × 2 cm. Spadix sessile, shorter than spathe, ca. 6 cm, ca. 1 cm in diam. Anthers ovoid, acuminate. Ovary hexagonal-cylindric, ca. 5 mm.

S Taiwan (Lan Yu) [Japan (Ryukyu Islands)].

The records of *Rhaphidophora perkinsiae* Engler from Lan Yu (T. S. Liu & T. C. Huang, Quart. J. Taiwan Mus. 16: 141. 1963; Fl. Taiwan 5: 813. 1978) are based on misidentifications of *R. liukiuensis* (see Fl. Taiwan, ed. 2, 5: 868. 2000). True *R. perkinsiae* is distributed in the Philippines.

3. *Rhaphidophora hookeri* Schott, Bonplandia (Hannover) 5: 45. 1857.

毛过山龙  mao guo shan long

Lianas, medium to large, to 15 m, moderately robust. Stem mid-green, cylindric, 8–12–[20] mm in diam., internodes short, 5–10 mm. Leaves clustered to short tips; petiole 12–30 cm, channeled, margins sharp; pulvini distinct, 1–2 cm; petiolar sheath reaching to or just short of apical pulvinus; leaf blade obliquely oblong, 27.5–45 × 15–30 cm, thinly leathery, midrib and primary veins minutely pubescent, base rounded, truncate, or subcordate, apex with an acumen 15–20 mm; primary lateral veins diverging at 40–70° from midrib (angle smaller closer to apex of blade). Inflorescences solitary at tips of free lateral shoots; peduncle pendent, 3–5 cm, subtended by 1 or 2 cataphylls; cataphylls caducous, ovate or ovate-lanceolate, 3–6 cm. Spathe outside green or gray-green, inside yellow, oblong-ovate, 5–6(–10) cm, thick, rostrum ca. 15 mm. Spadix sessile, yellow, obovoid, cylindric, or elliptic, 4.5–5.5 × 1.5–1.75 cm, at fruiting stage ca. 8.5 × 3.5 cm. Filaments ca. 2 mm; anthers oblong; staminodes 4, usually around base of ovary in distal part of spadix. Ovary hexagonal-cylindric; stigma subsessile, yellow, drying brown, longitudinally oblong; ovules many with slender funicle. Inflorescences pendent from tips of lateral shoots, broadly cylindric, 10–14 × ca. 3 cm; stigmas prominent. Fl. Mar–Jul.

Dense forests in mountain valleys, on large trees; 300–2200 m. Guangdong, Guangxi, Guizhou, Sichuan, SE Xizang (Mêdog), Yunnan [Bangladesh, Bhutan, NE India, Laos, Myanmar, Thailand, N Vietnam].

The stems are used medicinally for treating fractures.

大叶崖角藤  da ye ya jiao teng

Lianas, very large to gigantic, to 40 m, very robust. Stem cylindric, very thick, 3–4 cm in diam., internodes 1–6 cm. Leaves dense, spiro-distichous; petiole green, cataphyllate, 50–70 cm; petiolar sheath extending to ca. halfway, soon marcescent; leaf blade light green abaxially, green adaxially, ovate-oblong, very large, 50–70–[90] × 28–50 cm, stiffly leathery, base cordate, margin entire, apex abruptly acuminate; primary lateral veins 10–13 on each side, diverging at 80–90° from midrib. Inflorescences in fascicles of up to 4 inflorescences per synflorescence at tips of primary clinging shoots, appearing axillary. Peduncle green, 15–18 × ca. 2 cm. Spathe initially involuted, white-green, afterward spreading, light yellow, opening deep yellow, oblong-cymbiform, 20–27 × ca. 16 cm, very thick (ca. 2 mm when dry). Spadix sessile, yellow-green, when dry green-black, cylindric, 18–25 × ca. 2.5 cm, base oblique, apex obtuse. Stamens 4; filaments compressed, 2–3 × 0.5–1 mm; anthers yellow, small. Ovary tetragonal- or hexagonal-cylindric, ca. 7 mm; stigma sessile, punctiform; ovules narrowly ellipsoid or cylindric; funicle long and thin, base hairy. Inflorescences broadly cylindric, up to 30 × 5 cm. Fl. Apr–Aug.

 Moist rain forests in limestone areas, on large trees or on limestone; 600–1300 m. S Yunnan [N Laos, N Thailand, N Vietnam].

5. *Rhaphidophora hongkongensis* Schott, Bonplandia (Hannover) 5: 45. 1857.

狮子尾  shi zi wei

Lianas. Stem thick, rectangular in cross section; branches pendulous, 5–10 mm in diam.; internodes 1–4 cm, rooting; internodes of juvenile branches elongated to 6–8 cm, often producing aerial roots opposite to petiole. Petiole 5–10 cm, sheathing to pulvinus; pulvinus conspicuous, 4–10 mm; leaf blade pale green abaxially, green adaxially, usually falcate-elliptic, sometimes oblong-lanceolate, or oblanceolate, 20–35 × 5–6(–14) cm, base narrowly cuneate to minutely truncate, apex long acuminate; lateral veins many (but in fresh material almost invisible), diverging at 45° from midrib; juvenile stems with leaf blade obliquely elliptic, base narrowly cuneate on one side, rounded on other side, apex acute. Inflorescences terminal or appearing axillary; peduncle cylindric, 4–5 cm, apex ca. 10 mm in diam. Spathe early caducous, green to light yellow, ovate, 6–9 cm, involute, apex acuminate. Spadix pale green or light yellow, cylindric, 5–8 × 1.5–3 cm. Ovary hexagonal-cylindric, ca. 4 × 2 mm, apex truncate; stigma black, capitulate. Fruit yellow-green. Fl. Apr–Aug.

Valley rain forests, evergreen forests, on trees or stone walls; 100–900(–2000) m. Fujian, Guangdong, Guangxi, Guizhou, Hainan, Taiwan, Yunnan [?Indonesia, Laos, ?Malaysia, Myanmar, N Thailand, N Vietnam].

The plant is used medicinally for treating traumatic injuries, fractures, lumbago, rheumatism, and fevers.

大叶南苏  da ye nan su

*Pothos peepla* Roxburgh, Fl. Ind. 1: 454. 1820; *Monstera peepla* (Roxburgh) Schott; *Scindapsus peepla* (Roxburgh) Schott.

Lianas, medium to large, to 15 m, moderately robust. Stem pale green, terete, 8–12 mm in diam., rooting, internodes 2–5 cm, terete to weakly sulcate on opposite sides, branching usually short but abundant. Leaves tending to cluster at shoot tips; petiole light green, 10–20 cm, shallowly channeled; pulvinus thickened, 8–12 mm; petiolar sheath reaching pulvinus, marces-
cent; leaf blade oblanceolate, elliptic-oblong, or ovate-oblong to oblong-lanceolate, 8–25 × 4–11 cm, subleathery, base rounded to subtruncate, margin entire, apex abruptly acuminate or acute; primary lateral veins many, parallel, diverging at 45° from midrib. Inflorescences solitary, terminal on lateral free branches; peduncle erect, distally recurved, robust, 8–10 cm; bracts around base early caducous, linear, 6–7 cm, membranous. Spathe gaping and thence spreading at anthesis then caducous, dull orange outside, dull yellow to dull orange inside, elliptic-oblong or oblong in outline, 7–9 cm, apex with rostrum ca. 10 mm. Spadix sessile, obovate, white, or violet [or yellowish white or yellow], cylindric, 5.5–8 cm, ca. 4/5 of total spathe, 1–1.2 cm in diam. Stamens shorter than ovary during female anthesis; at male anthesis filaments extending to project thecae beyond pistil; anthers elliptic. Ovary tetragonal- or hexagonal-cylindric, ca. 2 × 2 mm; stigma oblong, small. Infructescence initially green, later turning dull orange prior to stylar plates sloughing away, broadly cylindric, 10–13 × ca. 3 cm. Fl. Sep–Oct.

Evergreen forests, valley forests, on trees or on stone walls; 1800–2800 m. Guizhou, Yunnan [Bangladesh, Bhutan, N Cambodia, NE India, Laos, N Myanmar, Nepal, N Thailand, N Vietnam].

The plant is used medicinally for treating fractures, traumatic injuries, rheumatic arthralgia, angina pectoris, bronchitis, and coughs.

Lianas. Stem 1–2 cm in diam., internodes 3–4 cm, branched. Petiole ca. 30 cm, sheathing; pulvinus ca. 15 mm; leaf blade broadly ovate, ca. 35 × 25–30 cm, leathery, base truncate in outline, pinnately divided; pinnae 3 or 4 on each side, linear-oblong, ca. 14 × 3–4 cm, apex falcate-truncate with ascending falcate tip, with 1 or 2 equally parallel costae, sinuses almost reaching midrib. Peduncle 15–18 cm × ca. 5 mm. Spathe yellow, 10–11.5 cm. Spadix sessile, cylindric, ca. 11 × 1.5–2 cm. Ovary hexagonal-cylindric, apex truncate; stigma sessile, circular. Berry many seeded. Seeds spotted, oblong, fusiform, ca. 2 × 0.7 mm. Fl. May–Aug, mature fr. next year.

Lianas, to 10 m, but frequently smaller, slender to rather robust. Stems 0.7–2.5 cm in diam., terete in cross section; climbing stems with internodes elongated and rooting; free lateral stems forming a complex series of branches eventually pendent under their own weight. Leaves scattered, with 1 foli-}

cent; leaf blade oblong, elliptic-oblong, or ovate-oblong to oblong-lanceolate, 8–25 × 4–11 cm, subleathery, base rounded to subtruncate, margin entire, apex abruptly acuminate or acute; primary lateral veins many, parallel, diverging at 45° from midrib. Inflorescences solitary, terminal on lateral free branches; peduncle erect, distally recurved, robust, 8–10 cm; bracts around base early caducous, linear, 6–7 cm, membranous. Spathe gaping and thence spreading at anthesis then caducous, dull orange outside, dull yellow to dull orange inside, elliptic-oblong or oblong in outline, 7–9 cm, apex with rostrum ca. 10 mm. Spadix sessile, obovate, white, or violet [or yellowish white or yellow], cylindric, 5.5–8 cm, ca. 4/5 of total spathe, 1–1.2 cm in diam. Stamens shorter than ovary during female anthesis; at male anthesis filaments extending to project thecae beyond pistil; anthers elliptic. Ovary tetragonal- or hexagonal-cylindric, ca. 2 × 2 mm; stigma oblong, small. Infructescence initially green, later turning dull orange prior to stylar plates sloughing away, broadly cylindric, 10–13 × ca. 3 cm. Fl. Sep–Oct.

Evergreen forests, valley forests, on trees or on stone walls; 1800–2800 m. Guizhou, Yunnan [Bangladesh, Bhutan, N Cambodia, NE India, Laos, N Myanmar, Nepal, N Thailand, N Vietnam].

The plant is used medicinally for treating fractures, traumatic injuries, rheumatic arthralgia, angina pectoris, bronchitis, and coughs.

Lianas. Stem 1–2 cm in diam., internodes 3–4 cm, branched. Petiole ca. 30 cm, sheathing; pulvinus ca. 15 mm; leaf blade broadly ovate, ca. 35 × 25–30 cm, leathery, base truncate in outline, pinnately divided; pinnae 3 or 4 on each side, linear-oblong, ca. 14 × 3–4 cm, apex falcate-truncate with ascending falcate tip, with 1 or 2 equally parallel costae, sinuses almost reaching midrib. Peduncle 15–18 cm × ca. 5 mm. Spathe yellow, 10–11.5 cm. Spadix sessile, cylindric, ca. 11 × 1.5–2 cm. Ovary hexagonal-cylindric, apex truncate; stigma sessile, circular. Berry many seeded. Seeds spotted, oblong, fusiform, ca. 2 × 0.7 mm. Fl. May–Aug, mature fr. next year.

The plant is used medicinally for treating fractures, traumatic injuries, rheumatic arthralgia, angina pectoris, bronchitis, and coughs.

**独龙崖角藤 da long ya jiao teng**

Lianas. Stem green, cylindrical, 1–2 m, 2–3 cm in diam., internodes 0.5–2.5 cm. Petiole 41–49 × ca. 1.5 cm, basal 3–4 cm sheathing; pulvinus indistinct; leaf blade pale green abaxially, green adaxially, oblong-ovate in outline, ca. 50 × 35 cm, subleathery, base rounded or subcordate, pinnately divided; pinnae 6–9 per side, broadly linear, oblique, those at middle of leaf 4–5 cm wide, apex truncate with falcate tip; costa 3 or 4, equally strong, parallel; sinuses nearly reaching midrib. Peduncle solitary, cylindrical, 15–20 cm × 8–10 mm. Spathe unknown. Spadix sessile, pale green, cylindric, ca. 10 × 1.8 cm. Ovary polygonal-cylindric, apex with short funicle; stigma sessile, linear-oblong, longitudinal. Fruit small. Seeds reniform, usually striate.

**爬树龙 cu jing ya jiao teng**

Lianas. Branches dorsiventrally compressed, to 3 cm in diam., internodes short. Leaf blade ovate in outline, 30–55 × 22–36 cm, leathery, base obtuse, apex acute, pinnately divided; pinnae 6–10 or more per side, reaching midrib or nearly so, linear-falcate, base decurrent, apex truncate; primary lateral veins usually 2–4, equally strong, parallel, along midrib with perforations (8–20 × 2–5 mm), pinnae at middle of leaf 15–21 × 1–5 cm. Inflorescences terminal on lateral branches, solitary, erect; peduncle robust, cylindrical, 12–20 × 1–1.6 cm. Spathe unknown. Spadix sessile, white, cylindrical, 10–17 cm, 2–2.5 cm in diam. at base. Ovary cylindrical, 6–8 × ca. 2 mm; ovules many, oblong, funicle long; style broadly conic; stigma circular. Fr. Nov.–Dec.

Dense tropical forests, on trees or over stones; below 1300 m. Guangxi, Hainan, Yunnan [N Laos, N Vietnam].

12. Rhaphidophora decursiva (Roxburgh) Schott, Bonplandia (Hannover) 5: 45. 1857.

**爬树龙 pa shu long**

*Pothos decussivus* Roxburgh, Fl. Ind. 1: 456. 1820 ["decussiva"]; *Monstera decussiva* (Roxburgh) Schott; *Rhaphidophora affinis* Schott; *R. insignis* Schott; *Scindapsus decussivus* (Roxburgh) Schott.

Lianas, very large, to 20 m or more, very robust. Stem green at back, yellow at front, robust, 3–5 cm in diam., rooting, internodes 1–2 cm. Leaves scattered, each foliage leaf separated from next by several (up to 7) cataphyll-bearing nodes; petiole green, cylindrical, 20–40 cm, shallowly canalicate; pulvinus indistinct; petiolar sheath extending to ca. 2/3 along petiole; juvenile leaf blade orbicular, ca. 16 × 13 cm, margin entire, apex abruptly acute; mature leaf blade pale green abaxially, green adaxially, oblong-ovate, ovate in outline, 60–70–[100] × 40–50 cm, base subcordate, margin irregularly and asymmetrically pinnately divided, apex acute; pinnae 9–15 per side, ca. 20 × 3–5 cm at mid-leaf, base narrowed, apex truncate with ascending falcate tip, with a strong costa. Inflorescences axillary, solitary; peduncle green, cylindrical, very robust, 11–20 × 1.5–3 cm. Spathe initially involute, afterward spreading, yellow on both sides, cymbiform, oblong-ovate, 17–20 × 10–12 cm. Spadix sessile, gray-green, cylindrical, 15–16 × 2–3 cm, base oblique. Filaments flat, ca. 5 mm, nearly as long as ovary, base angustate; anthers yellow, oblong, less than 1 mm. Ovary hexagonal-conic, ca. 5 × 3 mm; style distinct, ca. 1 cm; stigma yellow, longitudinally oblong; ovules many; funicle laterally inserted, slender. Infructescence 15–20 × 5–5.5 cm. Berry green-white, base white or yellow, hexagonal-obconic, ca. 18 × 5 mm, apex with a persistent style, stylar region green-white, sloughing to reveal white or yellow pulp cavity. Fl. May–Aug, fr. mature next Jul.–Sep.

Monsoon rain forests, valley evergreen broad-leaved forests, creeping on ground, over rocks, or climbing against trees; below 2200 m. Fujian, Guangdong, Guangxi, Hainan, Sichuan, Taiwan, SE Xizang (Mêdog, Zayû), Yunnan [Bangladesh, Bhutan, Cambodia, NE India, Laos, Myanmar, Nepal, Sri Lanka, Thailand, Vietnam].

The stems and leaves are used medicinally for treating traumatic injuries, fractures, swellings, colds, lumbago, snake bites, coughs, and bronchitis.

There has been much confusion over *Rhaphidophora decursiva* and *Epipremnum pinnatum* because both species have large, pinnatifid leaves, but *E. pinnatum* has a leaf blade with tiny perforations (ca. 2 mm) along and adjacent to the midrib, an ovary with 2 or 3 ovules, and a sessile, longitudinally linear-oblong stigma. There is also a difference in leaf arrangement: *R. decursiva* has foliage leaves scattered and interspersed with several (up to 7) cataphyll-bearing nodes, whereas *E. pinnatum* has leaves often clustered distally without such cataphyll-bearing nodes.

7. **EPIPREMNUM** Schott, Bonplandia (Hannover) 5: 45. 1857.

**麒麟叶属 qi lin ye shu**

Li Heng (李恒 Li Hen); Peter C. Boyce

Lianas, large to very large. Stems robust, woody, branched and rooting. Leaves long petiolate; petiole with pulvinus at junction with leaf blade, somewhat sheathing at base; leaf blade large, entire, pinnatifid, or pinnatisect, with perforations along midrib or not. Inflorescences terminal or sometimes displaced, solitary; peduncle robust. Spathe caducous, cymbiform, ovate, acute or acuminate. Spadix sessile. Flowers bisexual, sometimes with female ones at spadix base and these sterile, lacking perigone. Stamens 4(–6); filaments linear, flat; anthers much shorter than filaments; thecae ellipsoidal, longitudinally dehiscent. Ovary polygonal-cylindric, apex truncate, 1-loculed; ovules 2–4, inserted at base of parietal placenta, sometimes 6–8, distichous on parietal placentae, anatropous, with short funicle; stigma sessile, linear-oblong, longitudinal. Fruit small. Seeds reniform, usually striate.

About 20 species: tropical Asia, Australia, Pacific islands; one species in China. *Epipremnum aureum* (Linden & Andre) Bunting is cultivated in gardens.

藤芋属 **teng yu shu**

Li Heng (李恒 Li Hen); Peter C. Boyce

Lianas, creeping and climbing on trees with aid of adhesive roots. Stem robust, branched. Leaves spiro-distichous; petiolo usually sheathing or winged throughout their length; petiole undivided, pinnately veined, with very numerous parallel, thin lateral veins. Inflorescences solitary, near stem apex; peduncle at last laterally protruding from petiolar sheath. Spathe yellow, involute, 18–22 cm, apex acuminate. Spadix sessile, cylindrical, ca. 15 × 2.5 cm. Filaments ca. 4 mm; anthers ovoid, ca. 3 mm. Fruit ca. 9 × 5 mm, apex truncate, 1-seeded. Fl. Nov–Dec.

About 36 species: tropical Asia; one species in China.

海南藤芋 **hai nan teng yu**

*Rhaphidophora maclurei* Merrill, Philipp. J. Sci. 21: 337. 1922; *Scindapsus megaphyllus* Merrill.

Lianas. Stem robust, ca. 2.5 cm in diam. Petiole 26–32 cm, base imbricate, sheath reaching pulvinus; leaf blade pale green abaxially, green adaxially, dry pale brown, oblong-elliptic or ovate-elliptic, 23–46 × 12–24 cm, leathery, base subcordate, margin entire, apex acute or shortly acuminate; lateral veins numerous, diverging at 70–80° from midrib. Peduncle robust, smooth; apical pulvinus 16–70 × 3–5 mm, basal pulvinus 3–7 × 1–1.5 cm; petiolar sheath extending to halfway along apical pulvinus, disintegrating into netted fibers; leaf blade ovate to oblong-elliptic, 10–93 × 5–60 cm, submembranous, base slightly cordate, regularly pinnatifid to pinnatisect, apex acuminate; pinnae paler abaxially, adaxially dark green, 1.2–6.5 cm wide, with tiny perforations along and adjacent to midrib, pinnae each with 1 primary lateral vein and several parallel interprimary veins, higher order venation reticulate, midrib prominently raised abaxially, impressed adaxially. Inflorescence several together, partially obscured by netted fibers; peduncle pale green, 5.5–21.5 cm × 4–10 mm, terete. Spathe dull yellow to mid-green outside, dull yellow or pale green inside, canoecaped, 7–23.5 × 3–15 cm, stoutly attenuate to 15 mm, opening almost flat at anthesis. Spadix sessile, white, later glaucous gray-green to yellow, cylindrical, 8.5–25 × 1.1–3.5 cm, base slightly obliquely inserted. Flowers 3–7 mm in diam. Ovary cylindrical, 4–12 × 2–7 mm, basal part slightly compressed; ovules 2 or 3; stylar region trapezoid, 3–7 × 1.5–4 mm, rather robust, truncate; stigma longitudinally linear-oblong, 2–6 × 0.1–0.5 mm. Fruit mid-green. Seeds reniform, ca. 4.5 × 3.5 mm. Fl. Apr–Jul.

Tropical rain forests, mountain forests, creeping and climbing on trees, rocks, or stone walls; below 2000 m. Guangdong, Guangxi, Hainan, Taiwan, Yunnan [Bangladesh, Cambodia, India, Indonesia, Japan, Laos, Malaysia, Myanmar, Papua New Guinea, Philippines, Singapore, Thailand, Vietnam; Australia (Queensland), Pacific islands].

The plants are used medicinally to treat traumatic injuries, abscesses, and rheumatic arthralgia.

藤芋属 **teng yu shu**

Li Heng (李恒 Li Hen); Peter C. Boyce

Lianas, creeping and climbing on trees with aid of adhesive roots. Stem robust, branched. Leaves spiro-distichous; petiolo usually sheathing or winged throughout its length; leaf blade undivided, pinnately veined, with very numerous parallel, thin lateral veins. Inflorescences solitary, near stem apex; peduncle at last laterally protruding from petiolar sheath. Spathe not constricted, initially involute and tubular, afterward somewhat inflated, finally expanding only by a rather narrow longitudinal slit, never entirely or conspicuously flat-spreading, falling off as a whole leaving a thick scar on apex of peduncle. Spadix drying black, cylindrical, much thicker than peduncle. Flowers many, bisexual, naked. Stamens 4; filaments strap-shaped. Ovary with flat, often subrhomboid or quadrangular apex, 4–6-angular, 1-loculed; ovule 1, basal; stigma sessile, disciform to linear. Seeds subreniform.

刺芋属 ci yu shu

Li Heng (李恒 Li Hen); Peter C. Boyce, Josef Bogner

Herbs, evergreen, armored, helophytic or of forest swamps. Stem long creeping and stoloniferous with terminal part erect or ascending, with armed internodes. Leaves several, crowded at shoot apex; petiole long, aculate, inside with longitudinal air vessels; pulvinus well developed, solid; leaf blade sagittate-hastate, simple or divided, prickly abaxially on larger veins, pinnately veined above bifurcate basal veins; secondary venation reticulate. Inflorescences solitary, long pedunculate; peduncle prickly. Spathe constricted above spadix; basal part when mature opening by a slit, long caudate part involute and twisted, at last whole falling off. Spadix sessile, cylindric, within widened part of spathe. Flowers bisexual; tepals 4–6, free, with vaulted-truncate apex. Stamens 4–6; anthers elliptic, dehiscent by a longitudinal slit; filaments much longer. Ovary 1-loculed, 1-ovuled; ovule hanging from apex of locale; style very short; stigma subsemicircular. Fruit a berry; exocarp thin; mesocarp finely fibrous; endocarp rather thick, leathery, upper part and area around stigma prickly. Seed large, compressed; endosperm absent, embryo large, campylotropous.

Two species: tropical Asia; one species in China.

Dracodium spinosum Linnaeus, Sp. Pl. 2: 967. 1753; Lasia aculeata Loureiro; L. crassifolia Englert; L. desciscens Schott; L. hermannii Schott; L. heterophyllus (Roxburgh) Schott; L. jenkinsii Schott; L. loureiroi Schott; L. roxburghii Griffith; L. zollingeri Schott; Pothis heterophyllus Roxburgh; P. lasia Roxburgh; P. spinosus (Linnaeus) Buchanan-Hamilton ex Wallich.

Herbs, 1–2 m tall. Stem long creeping and stoloniferous, erect or ascending, ca. 2.5 cm in diam., internodes with stout prickles. Petiole 32–125 cm, laxly prickly, sometimes almost smooth; pulvinus 15–35 mm, aculate; leaf blade very variable, sagittate-hastate, 35–65 × 20–60 cm, simple or divided; anterior lobe entire or pedate to near midrib, acuminate; posterior lobes strongly downwardly directed to subsplaying, once or twice bifid with 3 or 4 narrow to rather long acute or acuminate lateral segments; primary lateral veins 2–4, strong, secondary lateral veins thinner, higher order veins very numerous, all vena
tion flush above, abaxially with rather small, straight to slightly curved prickles. Peduncle to 47 cm, laxly prickly. Spathe dull orange to black-red outside, dull yellow to rarely dull crimson inside, 18–35 cm with caudate part to 28 cm, proximally widened, very much shorter, 3–10 cm wide. Stipe of spadix ob
cure; spadix cylindric, 3–5 cm, in fruit elongated to 8 cm. Te
pals oblong, 1.5–3 mm, apex triangular hooded, keeled. Fila
cents ca. 1.5 × 0.8 mm; anthers ca. 0.8 × 0.8 mm. Ovary ovoid, ca. 1.5 mm high. Fruit obpyramidal, ca. 1 cm wide, densely warty-aculeate, sides unarmed, when dry irregularly ribbed, apex truncate. Seed ovoid-cordate, 5–7 mm. Fl. Jul–Sep.

Swamps, riverbanks, ditches, moist places in tropical and sub
tropical forests, sometimes cultivated along fish ponds and rice fields; below 1500 m. Guangdong, Guangxi, Hainan, Taiwan, S Xizang, Yunnan [Bangladesh, Bhutan, Cambodia, NE and SE India, Indonesia, Laos, Malaysia, Myanmar, Nepal, New Guinea, Sri Lanka, Thailand, Vietnam].

The Chinese record of Cyrtosperma lasioides Griffith (Fl. Hainan. 4: 129, 1977; FRPS 13(2): 13. 1979) was based on W. T. Tsang 553, collected in Hainan. This was, however, a misidentification, and the plants are actually Lasia spinosa (see H. Li et al., Acta Phytotax. Sin. 41: 577–581. 2003).

The young leaves are used as a vegetable. The rhizomes are used medicinally for treating tuberculosis of lymph nodes, swollen lymph nodes, stomach aches, snake and insect bites, injuries, and rheumatism.

水芋属 shui yu shu

Li Heng (李恒 Li Hen); Peter C. Boyce, Josef Bogner

Aroides Heister ex Fabricius; Callaria Rafinesque; Provenzalia Adanson.

Herbs, perennial. Rhizome creeping. Leaves several, distichous; petiole sheathing; sheath ligulate; long; leaf blade broadly ovate-cordate to cordate-oblancular, apex acute to acuminate; venation parallel-pinnate. Inflorescence solitary, flowering with leaf appearance; peduncle erect. Spathe persistent, fully expanded, elliptic to ovate, base decurrent, apex acuminate. Spadix stipitate, cylindric, apex obtuse. Flowers numerous, densely arranged, bisexual, naked (perigone absent), only uppermost flowers often male. Stamens free, usually 6, sometimes more (9–12); filaments flattened; anthers dorsifixed; connective short and slender; thecae ellip
soid, dehiscing by longitudinal slit; pollen grains diaperturate, globose, small, exine foveolate and apertural exine verrucate. Pistil ovoid, 1-loculed; ovules 6–9 (rarely more), anatropous and oblong; funicle distinct; placenta basal; stylar region attenuate; stigma subhemispheric, small. Inflorescence subglobose to broadly ellipsoid. Berry globose-connic, with many seeds (usually 4–9). Seed oblong-cylindric to somewhat ellipsoid; testa thick, scrobiculate toward chalaza and sulcate-striate toward micropyre; raphe prominent; embryo axile, elongate; endosperm copious. \( 2n = 36, 54, 72. \)

One species: N temperate regions and subarctic areas of Asia, Europe, and North America, including China.
1. **Calla palustris** Linnaeus, Sp. Pl. 2: 968. 1753.

水芋 shui yu

Rhizome creeping, green, cylindrical, to 50 cm, robust, 1–2(–3) cm in diam., somewhat spongy; nodes rooting. Cataphylls lanceolate, to 10 cm, apex acuminate. Petiole green, terete, (6–)12–24 cm (and longer to 30[–40] cm), base sheathing; sheath 7–8(–12) cm, with free ligule; leaf blade green, (4–)6–14 × (4–)6–14 cm; primary veins (8–)10–14(–18), pinnately arching from a strong midvein on each side, intramarginal vein inconspicuous. Peduncle green, terete, 15–30 × 0.8–1.2 cm. Spathe green outside, white inside, (3–)4–6(–8) × 3–3.5(–5) cm, apex with an acumen ca. 1 cm. Spadix 1.5–3 × 0.7–1.5 cm; stipe 5–7 mm. Flowers yellowish green, 2–2.2(–2.5) mm tall. Inflorescence (2–)3–5 × (1.5–)2.5–3.5 cm. Berries red, (5–)6–12 × (4–)5–10 mm. Seed brown, 3–5 × ca. 2 mm. Fl. May–Jul, fr. Aug–Sep.

Creeping helophyte on swampy shores of streams, rivers, lakes, and ponds, forest swamps, swampy meadows, in shallow water, often with *Sphagnum* moss; below 1100 m. Heilongjiang, Jilin, Liaoning, Nei Mongol [Asia, N Europe, North America].

千年健属 qian nian jian shu

Li Heng (李恒 Li Hen); Peter C. Boyce

Herbs, evergreen, aromatic. Stem creeping, erect or ascending. Leaves long petiolate; petiole sheathing up to halfway, usually longer than leaf blade, frequently distinctly articulate ca. halfway along; leaf blade oblanceolate, elliptic, lanceolate, deltoid, or sagittate, thinly to rather stiffly leathery, base usually cordate, apex acuminate usually with tubular tip; primary veins all diverging from midrib, with rather few basal, secondary veins striate, tertiary veins often numerous and very much thinner, all veins straight over most of their length, only near apex arcing into a submarginal vein. Inflorescences usually several together. Spathes persistent, often constricted. Spadix elongate; stipe very short or absent; female flowers usually each with an associated staminode; distal male zone usually separated from female zone by a ring of staminodes, very rarely a naked or near naked interstice; flowers unisexual, naked; female flowers: ovary incompletely 2–5-loculed with parietal and axile (very rarely basal) placentation, ovules numerous, semi-anatropous with long, slender funicle, style minute, stigma sessile or terminating a minute style, disciform or lobed; sterile flowers sometimes present at base of male axis of spadix; male flowers (fertile) consisting of 2–6 stamens, thecae extrorsely dehiscent by a slit, connective broad or narrow. Berry few or many seeded. Seeds on a long funicle, longitudinally striate, ovoid-lageniform.

About 110 species: tropical America and Asia; four species (two endemic) in China.

The problems presented by a lack of reliable taxonomy are compounded by the poor state of preservation of many of the historical types; the cryptic nature of most of the systematically significant morphologies, notably the presence, absence, and disposition of sterile flowers; the generally large and complex vegetative structures that do not lend themselves readily to traditional herbarium vouchering methodologies; and the fleeting antheric period such that even well-prepared herbarium specimens are frequently taxonomically useless because inflorescences were prepared post-anthesis, by which time many significant structures had deliquesced or been subject to pre-preservation damage by the most frequent inflorescence visitors, chrysomelid beetles, and post-preservation destruction by herbarium beetles.

*Homalomena* is a taxonomically complex group and, notwithstanding the above difficulties, is in urgent need of a rigorous study aimed at resolving the taxonomy and phylogeny. This is imperative not only because *Homalomena* is one of the most abundant, speciose, and least well understood of the mesophytic aroid genera in tropical Asia, but also because the genus is now becoming the focus of interest for pharmaceutical research due to the terpenoids and flavonoids occurring in the plant tissues; such studies must have a basis in sound taxonomic understanding or they risk being futile.

1a. Leaf blade rounded at base, ovate, ca. 18 × 12 cm.

2a. Inflorescences 1 or 2 together; staminode equaling associated pistil ......................................................... 1. *H. aromatica*

2b. Inflorescences up to 6 together; staminode exceeding associated pistil ......................................................... 4. *H. hainanensis*

1b. Leaf blade sagittate at base.

3a. Spadix ca. 3.5 cm × 4–6 mm ............................................................................................................... 2. *H. occulta*

3b. Spadix 4–5 cm × ca. 12 mm ............................................................................................................... 3. *H. kelungensis*
1. **Homalomena aromatica** (Sprengel) Schott in Schott & Endlischer, Melet. Bot. 20. 1832.

芬芳千年健 fen fang qian nian jian

*Zantedeschia aromatica* Sprengel, Syst. Veg. 3: 765. 1826; *Calla aromatica* (Sprengel) Roxburgh; *Zantedeschia foetida* K. Koch.

Herbs somewhat robust, stemless to decumbent, to 60 cm tall, smelling of camphor. Stem initially erect, later decumbent, 1–3 cm in diam. Leaves several together; petiole pale to mid-green with slightly darker longitudinal streaks, to 35 cm; petiolar sheath persistent, 4–7 cm, margins membranous; leaf blade mid-green, drying distinctly pale green, ovate-sagittate to elliptic-sagittate or lanceolate-sagittate, 20–30 × 10–17 cm, thinly leathery, base sagittate, sinus broad, ca. 5 cm, apex acute to long acuminate, with a tubular mucro ca. 2 mm; venation variously differentiated, posterior costae with 4–6 primary lateral veins arising ± simultaneously, anterior costa with 4–6 primary lateral veins and a similar number of virtually indistinguishable interprimary veins diverging from midrib at 45°, secondary venation striate. Inflorescences 1 or 2 together; peduncle erect (developing and floral) to declinate (post-anthesis and fruiting), colored as petiole, 10–18 cm. Spathe oblong, 8–10 cm; limb gaping at anthesis, then closing again. Spadix tapering cylindric, 7–9 cm, subequaling spathe, stipitate; stipe ca. 5 mm; female zone 1.5–3 × ca. 1 cm; ovary pale green, ovoid-globose, ca. 2 mm in diam., with an associated clavate staminode subequaling height; stigma sessile, capitate; staminate flower white, rhombic-hexagonal in apical view, 1–2 mm in diam., each comprising 2 stamens overtopped by a large connective. Inflorescence when ripe shedding spathe by slightly ragged basal abscission. Berries ripening dull orange yellow, smelling of overripe plums.

Evergreen perhumid broad-leaved tropical and subtropical forests, less often in drier habitats such as seasonally partially deciduous perhumid forests, but then always associated with permanent water; 200–1000 m. Guangdong, Guangxi, Hainan, Yunnan [Laos, Thailand, Vietnam].

Dense valley forests, bamboo forests, mountain shrub forests; below 100–1100 m. Guangdong, Guangxi, Hainan, Yunnan [Laos, Thailand, Vietnam].

One of us (Boyce) notes that the correct application of the name *Homalomena occulta* is obscure. The type (that almost certainly came from Huế in Vietnam) is lost, and the material that Schott annotated as being *H. occulta* consists of at least three species. The above description appears to be based on at least two species.

The aromatic rhizomes are used medicinally to treat traumatic injuries, fractures, stomach aches, lumbago, intestinal parasites, and rheumatic arthralgia.

台湾千年健 tai wan qian nian jian

Leaves 4 or 5; petiole ca. 60 cm, base sheathing; leaf blade broadly ovate, ca. 33 × 25 cm, membranous, base sagittate-cordate, margin entire, apex triangular-acute; veins almost parallel. Peduncle ca. 35 cm. Spathe pale green, ca. 6 cm, apex acute. Spadix cylindric, 4–5 × ca. 1.2 cm; female zone ca. 1.2 × 1.2 cm; ovary obovoid, 2–2.5 mm, apex obtuse; staminodes clavate; male zone ca. 3 × 1.3 cm, obtuse; stamens flattened, ca. 1.5 mm. Fl. Mar.

- N Taiwan (Jilong).

海南千年健 hai nan qian nian jian

Stem erect, ca. 40 cm tall, ca. 1.2 cm in diam. Petiole ca. 46 cm, basal 10–12 cm sheathing; leaf blade broadly ovate, ovate-oblong, ca. 18 × 11–12 cm, base broadly rounded, apex abruptly acuminate, acute with tubular tip 2–3 mm; primary lateral veins 5 or 6 per side, secondary veins numerous, parallel. Inflorescences several (up to 6) together; peduncle 4–5 cm, slender, 1–2 mm in diam. Spathe yellow-green, cymbiform, ca. 3.5 × 1.2 cm, apex with rostrum 3–4 mm. Spadix shorter than spathe, ca. 2.5 cm; female zone cylindric, ca. 10 × 3 mm; ovary ovoid; stigma subsessile, capitate; usually 1 staminode exceeding associated pistil; male zone clavate, ca. 2 cm × 1.5–3 mm, apex obtuse. Fl. Oct.

- Open forests on mountains. Hainan.

*Homalomena hainanensis* differs from other Chinese species in its leaf blade base broadly rounded (not cordate), spathe small (ca. 3.5 cm), spadix shorter (ca. 2.5 cm), and male zone clavate (ca. 2 cm).
12. SCHISMATOGLOTTIS Zollinger & Moritzi in Moritzi, Syst. Verz. 83. 1846.

落檐属 luo yan shu

Li Heng (李恒 Li Hen); Peter C. Boyce

Herbs, evergreen, creeping, stoloniferous, erect or rarely ascending, colony-forming, clump-forming, or solitary, terrestrial or rheophytic. Leaves ± crowded; petiole much longer than leaf blade, proximally sheathing; leaf blade usually paler or even glaucous abaxially, green adaxially, frequently with discoled banding along midrib or between midrib and submarginal veins, less often variously spotted, cordate, sagittate, less often lanceolate, softly subfleshy to thinly leathery; primary, secondary, and tertiary lateral veins parallel, or secondary and tertiary ones partly diverging at a narrow angle from primary veins, all reaching into a submarginal vein. Inflorescences usually several together; peduncle shorter than petioles. Spathe constricted, part below constriction persistent, enveloping female zone of spadix, distal spadix circumscissile and caducous [elsewhere variously caducus, marcescent, or less often persistent]. Stipe of spadix short or absent; proximal part of spadix axis equivalent to all or part of female zone adnate to spathe; spadix elongate; proximal part female, distal part male, these separated or not by an interstice either with staminodes or less often naked; male zone of spadix fertile proximally, sterile distally, falling off later than distal part of spathe. Flowers numerous, unisexual, naked; female flowers: ovary 1-loculed, ovules rather few to very numerous, on 2–4 parietal to subbasal placenta, stigma sessile, disciform; interpistillar staminodes sometimes present and female zone often with 1 or 2 rings of staminodes basally; male flowers: fertile flowers consisting of 2 or 3 connate stamens, filaments fused, connective thick, thecae excraved in center, dehiscing by a terminal pore, pollen shed in strings. Berry few to many seeded. Seeds subellipsoid, densely longitudinally grooved.

About 120 species: mostly in SE Asia, a few species in South America (although these possibly not congeneric); two species (one endemic) in China.

1a. Leaf blade elliptic or oblong-lanceolate, rounded or obtuse at base; spathe ca. 7 cm; spadix ca. 5 cm .......... 1. S. hainanensis
1b. Leaf blade oblong, cordate at base; spathe 12–15 cm; spadix longer than 10 cm .......... 2. S. calyptrata

Herbs, stoloniferous, forming dense colonies. Petiole 20–30 cm, proximal half sheathing; leaf blade glaucous abaxially, dark green adaxially, elliptic or oblong-lanceolate, 16–17 × 5.5–7 cm, both surfaces densely and minutely impressed punctate, base rounded or obtuse, apex acuminate; primary veins 8–10 per side, adaxially always raised toward midrib; secondary and tertiary veins arising mostly from midrib. Peduncle shorter than petioles, ca. 13 cm. Spathe convolute, pale green or white, ca. 7 cm; proximal part elliptic, ca. 2.5 × 0.6 cm, persistent; distal part convolute, horn-shaped; limb caducous. Spadix ca. 5 cm; female zone adnate to spathe, ca. 2.5 cm × 4–5 mm, attenuate toward apex; pistil oblong, ca. 1 mm, 1-loculed, with 2 parietal placenta; ovules numerous, anatropous, obovoid, with longitudinal striations; funicle long and slender, carried on placenta in 2 ranks; distal sterile zone clavate, ca. 13 × 5 mm, attenuate toward base, apex obtuse; staminodes cylindric; male zone cylindric, ca. 15 × 4 mm; fertile stamens with anthers subsecundate, dehiscing by a terminal pore. Fl. Aug.–Oct.

- Dense tropical forests, on rocks; 100–200 m. Hainan.

One of us (Li) notes that Schismatoglottis hainanensis differs from “S. cadieri” (Buchet & Gagnepain in Lecomte et al., Fl. Indo-Chine 6: 1118. 1942), from Vietnam, in having an elliptic or oblong-lanceolate leaf blade and a spadix with a sterile terminal appendix. The latter name was not validly published because no Latin description or diagnosis was provided (Vienna Code, Art. 36.1).

One of us (Boyce) is very doubtful that Schismatoglottis hainanensis is distinct from S. calyptrata. A final decision is deferred pending examination of the type of S. hainanensis.

2. Schismatoglottis calyptrata (Roxburgh) Zollinger & Moritzi in Moritzi, Syst. Verz. 83. 1846.

Koch.

Herbs, stoloniferous, 15–60 cm tall. Petiole 5–50 cm, smooth, proximal 1/3 sheathing, sheath persistent; leaf blade mid-green, sometimes variegated, cordate to sagittate, 7–35 × 4–18 cm; midrib abaxially prominent, primary lateral veins 6–15 per side, entirely raised abaxially, nearly always raised adaxially toward midrib, marginally impressed, secondary venation arising mostly from midrib. Inflorescences 1–8 together; peduncle erect at anthesis, then deflexed, 6–20 cm. Spathe 3.5–12 cm, basal part green, narrowly ovoid, ca. 1/2 length of whole spathe limb, differentiated by an abrupt constriction, at female anthesis much inflated, creamy to pale greenish yellow, narrowing and...
C. crispatula

旋苞隐棒花 xuàn bāo yǐn bàng huā

Rhizome sometimes with a metallic blue-gray color, 0.5–1 cm in diam., irregularly thickened. Root system sometimes with many finely branched upright roots. Leaves green to brown, very variable, narrowly linear to lanceolate, 10–70 × 0.2–4 cm, smooth to undulate to bullate, margin entire to finely, irregularly denticate; broader leaf blades mostly with conspicuous lateral veins. Generally, two ecological leaf forms occur: 1) plants that grow submerged for most of the year, thus developing long flaccid-lax submerged leaves (sometimes also developing shorter, stiffer emergent leaves); 2) plants that develop short terete leaves during rainy season and, when water level decreases, form normal emergent leaves at anthesis. Spathe outside greenish to brownish, 10–40(–60) cm; kettle 1–2.5 cm, inside somewhat constricted below male flowers, inside ± reddish (especially distally) and with alveolae (depressions in wall) in distal part; flap closing kettle sometimes ± purple spotted; tube slightly to somewhat twisted, 5–30(–45) cm; limb ± spirally twisted, yellowish to grayish, with short to long, purple to reddish markings, sometimes markings almost completely covering surface, or few and faint, or absent, (1.5–)3–8(–12) cm; collar not present. Spadix: female flowers 4–6, with horizontal to vertical, round to ovoid stigmas; olfactory bodies ± irregularly lobed with protruding cells; male flowers 90–130, thecae from protruding cells. Fruit splitting in a septical/septifragal-keratin-like way, greenish to purplish, narrowly globose, 1.5 cm in diam. Seeds brownish, 5–8 mm, rugose; endosperm present; embryo cone-shaped with an undifferentiated plumule. 2n = 36, 54.

Rivers, streams; near sea level to 600 m. Guangdong, Guangxi, Guizhou, Yunnan [Bangladesh, Cambodia, Laos, Myanmar, Thailand, Vietnam].

Cryptocoryne crispatula s.l. is here interpreted as one species comprising different ecological races, i.e., leaf forms that are adapted to the water supply and the overall topography of the rivers in which they grow. In rivers with more constant water-bearings, and not too steep
fall, the more aquatic ones occur, viz. the long, narrow-leaved forms with an undulate or bullate leaf blade. In rivers with a seasonal variation in the water-bearing, the more amphibious ones occur, characterized by having shorter, ± smooth leaves. The variation within *C. crispatula* is very complex, with more than six recognizable forms in mainland Asia, some more readily distinguishable from the next than others. There are transitions between the various forms. The here recognized varieties represent the more distinctive ones, and admittedly specific plants may only with some difficulty be referred unambiguously to a definite variety. The number of varieties accepted is subjective. This is not meant as an excuse for an insufficient treatment but is merely recognition of the complexity of *C. crispatula*.

It is important to note that the leaves can vary in size during the flowering season; therefore, herbarium material should be studied with this in mind.

In the present circumscription, *Cryptocoryne crispatula* is recognized as different from the tetraploid *C. retrospiralis* (Roxburgh) Kunth from India. If *C. crispatula* were not recognized as different from *C. retrospiralis*, the mentioned varieties of *C. crispatula* would then be considered as varieties of *C. retrospiralis*.

In addition to the four varieties here recognized in China, *Cryptocoryne crispatula* var. *tonkinensis* (Gagnepain) N. Jacobsen (Aqua Pl. 16: 29. 1991; *C. tonkinensis* Gagnepain, Notul. Syst. (Paris) 9: 133. 1941; *C. retrospiralis* (Roxburgh) Kunth var. *tonkinensis* (Gagnepain) de Wit) occurs in Thailand and Vietnam, where it grows along rivers and streams. It has not yet been recorded from China, but may be distinguished as follows. Leaves usually submerged, green to brownish, 5–30 × 0.2–0.4 cm, smooth or slightly undulate. Emergent leaves and spathes develop. Spathe with a tube 10–20 cm; limb with a rather long, somewhat tight to open spiral, usually grayish, mostly with shorter or longer purplish markings of varying intensities, but also a completely white limb has been found. Fl. Dec–Apr. 2n = 36, 54.

Stream and river banks and beds. Guangdong, Guangxi, Guizhou [Bangladesh, Cambodia, Laos, Myanmar, Thailand, Vietnam].

**1b. Cryptocoryne crispatula** var. *yunnanensis* (H. Li) H. Li & N. Jacobsen, comb. et stat. nov.

八仙过海 ba xian guo hai

Leaves upright to flat on soil surface, rather stiff (in shaded habitats more lax), mostly green but often brownish (to brown) with markings in sun-exposed habitats, lanceolate to strap-shaped, 10–30 × 0.5–1(-2.5) cm, smooth to somewhat finely undulate to crenulate along margin, entire or distinctly irregularly serrulate. During times of high water, leaves become small and terete, and when becoming emergent, leaves and spathes develop. Spathe with a tube 10–20 cm; limb with a rather long, somewhat tight to open spiral, usually grayish, mostly with shorter or longer purplish markings of varying intensities, but also a completely white limb has been found. Fl. Nov–Apr. 2n = 36.

Riverbanks, riverbeds; near sea level to 600 m. Yunnan [Laos, Thailand, Vietnam].

The plants are used medicinally for treating traumatic injuries, rheumatic arthralgia, and stomach aches.

广西隐棒花 guang xi yin bang hua

*Cryptocoryne balansae* Gagnepain, Notul. Syst. (Paris) 9: 131. 1941; *C. kwangsiensis* H. Li; *C. longispatha* Merrill.

Leaves usually submerged, green to brownish to dark brown, rather flaccid, 15–70 × 1–4 cm, slightly to strongly bullate; midrib conspicuous, lateral veins less so. Emergent leaves and spathes develop. Spathe with a long tube 10–30 cm; limb with a rather long and rather open to somewhat tight spiral, usually grayish or yellowish, mostly with shorter or longer purplish markings of varying intensities. Fl. Dec–Apr. 2n = 36.

柔叶隐棒花 rou ye yin bang hua

Leaves usually submerged, green to reddish brown, flacc-
cid, 20–50 × 0.5–1.2 cm, somewhat undulate to almost smooth. Emergent leaves shorter and rather smooth compared to submerged ones. Spathe with a long tube (15–)20–30 cm; limb with a rather long, open spiral, usually grayish, mostly with shorter or longer purplish markings of varying intensities. Fl. Dec–Apr. 2n = 56.

14. HAPALINE Schott, Gen. Aroid. 44. 1858, nom. cons.
细柄芋属 xi bing yu shu
Li Heng (李恒 Li Hen); Peter C. Boyce

Hapale Schott.

Herbs, seasonally dormant or evergreen, small to medium sized, slender. Stems tuberous-stoloniferous with stolons terminating in further small, depressed-globose tubers. Leaves usually solitary, or few; petiole sheath short; leaf blade pale to deep green with or without silvery or paler variegation, cordate-sagittate, sagittate, or hastate, rarely elliptic and cuneate, primary lateral veins pinnate or mostly arising at petiole insertion, forming arching submarginal collective vein, 1 or 2 marginal veins also present; higher order venation reticulate. Inflorescences 1–5 per each floral sympodium, appearing with leaf; peduncle subequal to or longer than tepalodes, slender. Spathe slender, not distinctly constricted; tube persistent, very slender, tightly convolute around female flowers; limb erect to reflexed and ± revolute at anthesis, oblong-lanceolate, longer than tube, marcescent. Spadix subequal to or longer than spathode, female zone adnate to spathe, few flowered (2–7), ± biseriate, separated from male zone by short sterile zone; male zone subulate to cylindric, fertile to apex or with a few sterile flowers at apex or with a long, terminal appendix [Hapaline appendiculata Ridley]. Flowers unisexual, naked. Gynoeicum oblong to lageniform; ovary 1-loculed; ovule 1, anatropous; funicle very short; placenta parietal to subbasal (morphologically basal); stylar region very short; stigma subcapitate. Male flowers 3-androus; synandrium peltate, truncate, hexagonal, elongated in direction of spadix axis, shallow, stipitate; connective strongly dilated; thecae remote, sub-globose, short, almost pendent from margin, dehiscing by pore; synanandrodes with proximal ones very few, ± remote, apiculiform; distal ones very few, consisting of tiny, peltate synanandrodes. Fruit an ellipsoid to globose berry; style persistent; pericarp thin, 1-seeded, white. Seed ellipsoid; testa smooth, very thin; embryo light green, ellipsoid, large; endosperm absent.

Six species: SE Asia; one species (endemic) in China.

细柄芋 xi bing yu

Herbs, perennial. Tuber cylindrical, 1–2 cm × ca. 5 mm, with many tubercles. Cataphylls lanceolate, 3–4 cm, membranous. Leaves 2 or 3; leaf blade oblance-elliptic, 10–17 × 5–8.5 cm, base 2-lobed, apex abruptly acuminate; lobes deltoid, 2–4 × 1–3 cm; primary veins multiple, pinnately diverging from midrib, secondary venation arching-anastomosing, intramarginal veins 3, conspicuous. Peduncles 2 or 3, 18–30 cm, very slender; cataphylls ca. 8 cm. Spathe ca. 5 cm; tube convolute, ca. 2 cm × 1–2 mm; limb spreading and finely reflexed, lanceolate, ca. 8 cm × 8 mm. Spadix ca. 4.5 cm; female zone ca. 1.5 cm, adnate to tube of spadix; ovaries 4–12, oblong, multistriate, 1-loculed, 1-ovuled; stigma disciform; sterile zone between male and female inflorescences ca. 7 mm, naked; male zone ca. 1.5 cm; male flowers peltate, hexagonal, apex ca. 5 mm; sterile male zone at apex of spadix ca. 7 mm, with minute syanandrodes. Fl. Apr.

● Tropical forest; ca. 300 m. SE Yunnan (Hekou).

广东万年青属 guang dong wan nian qing shu
Li Heng (李恒 Li Hen); Peter C. Boyce

Herbs, evergreen, sometimes robust. Stem epigeal, erect to decumbent and mostly unbranched or creeping and often branched, internodes green, becoming brown with age, smooth, often rooting at nodes when decumbent. Leaves several, forming an apical crown; petiole shorter than leaf blade, sheath usually long; leaf blade often with striking, silvery and pale green variegated patterns, ovate-elliptic or narrowly elliptic, rarely broadly ovate or sublinear, base often unequal, attenuate to rounded, rarely cordate; primary lateral veins pinnate, often weakly differentiated, running into marginal vein, higher order venation parallel-pinnate. Inflorescences 1–9 per each floral sympodium; peduncle shorter or longer than petioles, sometimes deflexed in fruit. Spathe caducous, persistent, or marcescent, erect, green to whitish, boat-shaped to convolute, not differentiated into tube and blade, ovate to ± globose, slightly to strongly decurrent, often apiculate. Spadix cylindrical to clavate, shorter or longer than spathe, stipe long to almost absent; female zone rather few flowered, either separated by staminodes or contiguous with, and much shorter than, male zone; male zone fertile to apex, rarely with staminodes basally. Flowers unisexual, naked. Female flowers: ovary subglobose, 1-loculed; ovule 1, anatropous, broadly ovoid; funicle very short; placenta basal; stylar region short, thick; stigma broad, disciform, concave centrally. Male flowers: stamens free, not forming clear floral groups; filaments usually distinct, connective thickened; thecae opposite, obovoid, short, dehiscing by
apical pore or reniform transverse slit. Fruit an ellipsoid berry, outer layer fleshy green but turning yellow, rarely white and finally red. Seed solitary, ellipsoid, almost as large as berry; testa thin, ± smooth; integument inconspicuous; embryo large; endosperm absent.

Twenty-one species: tropical and subtropical Asia; two species in China.

_Aglaonema ovatum_ Engler (Bot. Jahrb. Syst. 25: 21. 1898) is abundant in N Laos next to the Chinese border and so is expected to be found eventually in SW China.

Many species are widely cultivated in gardens as evergreen ornamental plants.

1a. Spadix shorter than spathe, ca. 2/3 spathe length, male zone of spadix cylindric, 20–30 × 3–4 mm ................. 1. _Aglaonema modestum_

1b. Spadix equaling to longer than spathe, male zone of spadix conic, ca. 23 × 9–10 mm ..................... 2. _Aglaonema simplex_

1. _Aglaonema modestum_ Schott ex Engler in A. Candolle & C. Candolle, Monogr. Phan. 2: 442. 1879.

广东万年青  guang dong wan nian qing

Plants erect. Stems green, 40–70 cm, 1.5–2 cm in diam. Leaves mostly crowded at stem apex; petiole green, 5–20 cm, sheathing for more than 1/2 length; leaf blade pale green abaxially, green adaxially, ovate to ovate-lanceolate, base obtuse or broadly cuneate, apex acuminat; primary lateral veins 4 or 5 per side, ascending and arching, secondary ones indistinct, parallel to primary veins. Peduncle (5–)10–12.5 cm. Spathe oblong-lanceolate, (5.5–)6–7 × 1.5–2 cm, apex long acuminate. Spadix cylindric, ca. 2/3 of spathe length, with a stipe ca. 10 mm; female zone 5–8 mm; ovary globulose; style short; stigmas dehiscent by a pore. Berry green to yellow-red, red when ripe, oblong, ca. 20 × 8 mm. Seed oblong, ca. 1.7 cm. Fl. May, fr. Oct–Nov.

Dense forests, also widely cultivated in gardens as evergreen ornamental plants; 500–1700 m. Guangdong, Guangxi, Guizhou [N Laos, N Thailand, N Vietnam].

The plant is used externally as a medicine to treat snake and insect bites, hydrophobia, abscesses, and swelling.

2. _Aglaonema simplex_ (Blume) Blume, Rumphia 1: 152. 1837.

越南万年青 yue nian wan nian qing

_Caladium simplex_ Blume, Catalogus, 103. 1823; _Aglaonema angustifolium_ N. E. Brown; _A. birmanicum_ J. D. Hooker; _A. fallax_ Schott ex Engler; _A. longicuspis_ Schott; _A. pachystachyum_ Engler; _A. schottianum_ Miquel f. angustifolium (N. E. Brown) Engler; _A. siamense_ Engler; _A. simplex f. angustifolium_ (N. E. Brown) R. N. Jervis; _A. tenuipes_ Engler; _Scindapsus tonkinensis_ K. Krause.

Plants perennial, erect. Stems dark green, cylindric, 40–80 cm tall, 1–2 cm in diam., rooting at nodes; internodes 2–3 cm, at distal part 5–10 mm; cataphylls early caducous, broadly linear, 4–7 cm, apex abruptly acute. Leaves usually 5 or 6, densely crowded at stem apex; petiole green, 6–15 cm, proximally sheathing; leaf blade initially involute, afterward spreading, pale green abaxially, dark green adaxially, ovate-oblong, 10–25 × 5.5–11 cm, thinly leathery, base truncate-rounded, subcordate, or decurrent, apex caudate-acuminate or abruptly long acuminate; primary lateral veins 6–8 per side, ascending and arching. Peduncle green, 2–6 cm. Spathe initially involute-tubular, afterward opening by a slit, cymbiform, ovoid, 3–4.5 × ca. 1.3 cm. Spadix 2.5–4.5 cm, slightly longer than or equaling spathe; female zone ca. 5 mm; ovary globulose; ovule basal; stigma sessile, circular; male zone 2–3 cm; stamens 4; anthers 2-celled. Berry oblong, 12–18 × 7–10 mm. Seed oblong, 11–15 mm. Fl. Apr–Jun, fr. Sep–Oct.

Dense valley forests; below 1500 m. SW Yunnan [Cambodia, India (Nicobar Islands), Indonesia, Laos, Malaysia, Myanmar, Philippines (Palawan), Thailand, Vietnam].

_Nicolson_ (Smithsonian Contr. Bot. 1: 38–41. 1969) maintained _Aglaonema tenuipes_ and _A. simplex_ as separate species primarily on inflorescence size and to a much lesser extent on phyto geography (_A. simplex_ being a Sundaic element with _A. tenuipes_ a N Thai/Indochinese species). However, there is complete introgression between even the extremes of the spathe size, while the presence of populations intermediate between “_A. tenuipes_” and _A. simplex_ in the mountainous parts of C and SE Thailand seriously weakens the phyto geographical arguments.

蘑芋属 mo yu shu

_Li Heng_ (李恒); Wilbert L. A. Hetterscheid

_Brachyspatha_ Schott; _Candraum_ Reichenbach ex Schott & Endlicher; _Conophallus_ Schott; _Hydroxme_ Schott; _Kunda_ Rafinesque; _Python_ Martius.

Herbs, terrestrial, small to massive. Stem subterranean, tuberous, rarely a chain of tubers or a true rhizome; rhizome ± creeping. Leaves usually solitary, rarely paired or more; petiole terete, rarely angulate, shallowly grooved, or partly rugulose, rarely entirely verrucate or hairy; leaf blade decompound, divided into 3 main segments; main segments equally long or anterior shorter than posterior ones (blade ± subpedate); rachises naked, narrowly or broadly winged and often carrying supernumerary leaflets on proximal parts; bulbils sometimes developing on leaves, either epiphyllar, intercalary (developing inside rachis), or half-epiphyllar (base developing in rachis, apex exposed beyond rachis). Inflorescence 1, rarely 2 or 3 (synflorescence) or more per season (then
ARACEAE

developing from different buds on stem), epigeal, rarely partly buried, solitary or simultaneous with or directly preceding leaf development, rarely emerging after leaf development. Spathe base convolute, rarely open or connate, not or clearly separated from limb by a constriction, outside variously colored, variously shaped, often cymbiform or campanulate, rarely funnelf-shaped; limb erect, spreading, oblique, or arching. Spadix sessile or shortly stipitate; female zone contiguous with male zone or separated from it by a sterile zone; flowers sometimes surrounded by staminodes; female flowers consisting of 1 pistil; ovary sessile or shortly stipitate, 1–4-loculed, with 1 ovule per locule, basifixed, or rarely axillary ca. halfway up ovary; style present or (nearly) absent, clearly separated from ovary or less so, sometimes with apical projections (“branches”) extending beyond stigma; sterile zone (when present) covered with staminodes, rarely partly or entirely naked; male zone cylindric, fusiform, conic, or obconic; male flowers consisting of (1–)3–6–8 stamens; stamens depressed or elongate; filaments present or nearly absent, separated or partly or entirely fused within a flower or rarely fused between adjacent flowers; anthers bithecal; thecae 2-celled (with 2 pollen sacs), rarely 1-celled; pores apical, rarely lateral or subterminal; pollen inaperturate, globose or elliptic, exine rarely absent, psilate, striate, echinate, areolate, porate, fossulate, reticulate, or scabrous; appendix rarely absent, contiguous with male zone or separated by a constriction or a short stipe, sometimes with large longitudinal folds or ± irregular deep cracks. Berries crowded or distant, ripening red, rarely blue, globose, ovoid, or narrowly elliptic, smooth or rarely verrucate, 1–4-seeded. Seeds usually with a distinct raphe; endosperm absent.

About 200 species: paleotropical, W to E Africa, S and SE to E Asia, N Australia, Pacific islands; 16 species (seven endemic) in China.

Amorphophallus stipitatus Engler (Notizbl. Bot. Gart. Berlin-Dahlem 8: 457. 1923) was described based on cultivated material in the Berlin Botanical Garden, originally from Guangdong. The holotype (Mess. s.n., B) has been destroyed, and Engler’s protologue does not give enough clues as to the identity of the species to which the name refers. It is no doubt a member of the A. yunnanensis alliance, but the differences between species recognized in this group are too subtle to leave room for any guessing about the identity of A. stipitatus. So as not to confuse matters, this name is here treated as of uncertain application.

The status of Amorphophallus zengianus C. Long & H. Li (Novon 10: 125, 2000), described from S Yunnan (Jinping), is uncertain. H. Li notes that the morphology of the inflorescence might be misleading because it was damaged while in the bud stage. She considers it to be conspecific with A. yunnanensis, based on morphological similarity of the petiole and leaf blade. On the other hand, Hetterscheid considers A. zengianus to represent a less-than-optimal specimen of A. krausei, based on photographs provided by H. Li of living material of A. zengianus. This identity with A. krausei could be confirmed if there exists a staminodal zone between the male and female zones of the spadix. However, H. Li notes that the living material no longer exists and the holotype specimen cited in the protologue (C. L. Long 98003, KUN) never existed.

“Amorphophallus tienmushanensis” (Y. Z. Tao, Compreh. Invest. Rep. Nat. Resource Tianmu Mount. Nat. Reserve, 130. 1992) was described from Zhejiang (Tianmu Shan). The present authors consider this name to be not validly published because the requirement of Art. 36.1 of the ICBN could be confirmed if there exists a staminodal zone between the male and female zones of the spadix. However, H. Li notes that the living material no longer exists and the holotype specimen cited in the protologue (C. L. Long 98003, KUN) never existed.

The following species were recorded in FRPS but are, in fact, not distributed in China: Amorphophallus bangkokensis Gagnepain (FRPS 13(2): 91, 99, 1979), A. mekongensis Engler & Gehrmann (p. 91), A. oncophyllus Prain ex J. D. Hooker (p. 98; A. muelleri Blume), and A. variabilis Blume (p. 95).

1a. Underground part a terete rhizome or chain of tubers.
   2a. Underground part a terete creeping rhizome ................................................................. 5. A. hayi
   2b. Underground part a chain of tubers ............................................................................. 2. A. coaetanus

1b. Underground part a single tuber.
   3a. Peduncle shorter than or equal to spathe.
      4a. Spathe limb erect, concave or straight; appendix whitish or pinkish.
         5a. Spathe limb concave; spadix shorter than spathe; appendix whitish, conic .................. 14. A. yuloensis
         5b. Spathe limb straight, distally slightly widening; spadix longer than spathe; appendix whitish or pinkish, conic or fusiform-conic and laterally compressed ........................................... 15. A. xiei
   4b. Spathe limb horizontal, campanulate; appendix dark purple.
      6a. Appendix narrowly conic, sometimes with scattered hairs ......................................... 6. A. henryi
      6b. Appendix globose or broadly conic ............................................................................. 12. A. paenifolius

3b. Peduncle distinctly longer than spathe.
   7a. Spadix distinctly stipitate.
      8a. Appendix with a strongly cerebriform (brainlike) surface ........................................ 3. A. corrugatus
      8b. Appendix glabrous, shallowly or deeply fissured, partly or entirely echinate.
         9a. Appendix deeply fissured/cracked lengthwise ......................................................... 8. A. kachinensis
         9b. Appendix glabrous, with shallowly concave sides, or partly or entirely echinate.
            10a. Appendix variously laterally compressed, sides shallowly or more deeply concave, glabrous; stigma hardly broader than style ................................................................. 16. A. yunnanensis
10b. Appendix terete or dorsiventrally compressed, sides convex, glabrous or entirely or distally echinate; stigma distinctly broader than style ............................................................................ 4. A. dunnii

7b. Spadix sessile.

11a. Male and female zones separated by sterile zone with ovate or elliptic, slightly convex staminodes.

11b. Male and female zones contiguous or with different types of staminodes in between.

11a. Male zone distinctly longer than appendix .............................................................................................................. 11. A. krausei

11b. Male zone equaling appendix ................................................................................................................................. 1. A. albus

12a. Male zone distinctly longer than appendix ............................................................ 11. A. krausei

12b. Male zone equaling appendix .................................................................................... 11. A. krausei

15a. Stigma sessile or nearly so; appendix glabrous or with a few scattered hairs .............. 9. A. kisianus

15b. Stigma distinct; appendix densely covered with long hairs or glabrous.

16a. Appendix densely covered with long hairs ...................................................................................... 7. A. hirtus

16b. Appendix glabrous ...................................................................................................................... 10. A. konjac

白蘑芋 bai mo yu

Tuber brown, subglobose, 5–6 cm high, 7–10 cm in diam., seasonally producing long rhizomatous offsets, these to 23 × 1.5 cm. Leaf solitary; petiole pale green with grayish green, irregular, elongate or rounded spots, and whitish dots, 40–70 × 1.5–2 cm, glabrous; leaf blade ca. 80 cm in diam., rachises winged; leaflets elliptic-lanceolate, 2–12 × 1–3 cm, acuminate. Inflorescence solitary, long pedunculate; peduncle 16–30 × 1–2 cm. Spathe cymbiform, narrowly ovate, 12–22 × 6–10 cm, acute; proximal margin of limb recurved, outside base green to pale green, inside creamy white; outside limb pale green, spotted with dark green and near margin with numerous indistinct white punctiform dots, inside creamy white with a faint pale green flush, base within densely verruculose. Spadix producing a heavy gaseous smell during female anthesis, sessile, bright pale green, turning yellowish during male anthesis, slightly curved, shorter than spathe, ca. 13.5 cm; female zone cylindric, ca. 1 × 1.2–1.3 cm, flowers congested; ovary bright green, depressed, angulate in cross section, ca. 1.5 mm high, 2.5–3 mm in diam., 2-loculed, but 1 locule reduced and sterile; style strongly oriented parallel to spadix axis, bright green, distally pale to yellowish green, 2.25 × ca. 1 mm; stigma lateral, slightly arching, whitish disciform, ca. 1.5 mm in diam., ca. 0.8 mm thick, entire, strongly scabrous; sterile zone between male and female zone swollen, slightly conic, 1.25 × 1.8 cm; staminodes congested; staminodes consisting of sterile entire flowers, off-white, slightly hemispheric, irregular, largest ca. 12 × 7 mm, with shallow irregular depressions, or with a few irregular grooves; male zone narrowly conic, apex slightly expanded, ca. 4 × 0.8 cm, 10 cm in diam. at base, flowers congested; male flowers consisting of 3 or 4(5) stamens; stamens ca. 2 cm; filaments entirely fused, off-white, 1.3 mm; anthers ca. 0.7 × 2 mm, truncate; thecae off-white, opening with apical rounded pores; connective dirty pale yellowish, flat, raised after anthesis; appendix narrowly conic, ca. 6 × 1.6 cm, finely rugulose, apex obtuse. Berries orange-red when mature, ovoid.

- Open forests, arid thickets; 800–1000 m. S Sichuan, NE Yunnan.

This species is used as a crop plant and is cultivated in Yunnan.

桂平蘑芋 gui ping mo yu

Amorphophallus arnautoffii Hetterscheidt; A. pingbianensis H. Li & C. L. Long.

Tuber persistent, dark brown to blackish, depressed globose, to 3 cm high, to 6 cm in diam., chained with others to form a pseudorhizome of 2–6 modules, each 3–5 cm in diam. Leaves 1–3, lasting up to 3 years; petiole uniformly dark green, terete, 60–120 × 1–2 cm, turgid, glabrous; leaf blade to ca. 100 cm in diam.; rachises only winged distally, common base of 3 main branches sometimes developing into an intercalary bulbil; leaflets dark green, oblanceolate, 15–20 × 4–6 cm, acuminate. Inflorescence long pedunculate; peduncle colored as petiole, 10–50 × 0.6–1.3 cm. Spathe shortly convolute at base, outside green, dirty green flushed with dirty brownish purple or distal half entirely brownish purple; inside uniformly green or background color dirty green, at base and along midrib flushed dirty dark purplish, near apex less so, or base pale green and rest flushed with brownish purple, narrowly triangular to triangular-ovate, 7.5–15 × 3–7 cm, base within glabrous or nearly glabrous with a few scattered, small, punctiform warts, apex acute. Spadix giving off a heavy gaseous stench at female anthesis, sessile, pale yellowish green with a very faint greenish flush, as long as or longer than spathe, 10–19.5 cm; female zone cylindric, 1–2 × 1–1.6 cm, flowers congested; ovary green or pale whitish green, strongly depressed, depressed globose, or subglobose, 1.5–2 mm high, 1.5–4 mm in diam., angulate or irregularly orbicular in cross section, 1- or 2-loculed; style straight or slightly upcurved, pale green, 1–2 × ca. 0.8 mm; stigma pale yellowish or pale greenish, flattened, disciform or nearly so, 0.7–0.8 mm high, 0.8–2 mm in diam., irregularly orbicular or elliptic in cross section, entire with a shallow, elongate, central depression or shallowly 2-lobed, or more distinctly bilabiate, margin with 2 small notches or a few small lobes, densely verruculose or echinulate; male zone cylindric, apex slightly widened, terete or slightly compressed, 2.3–4.5 × 0.7–1.5 cm, flowers congested; male flowers consisting of 3 or 5 stamens; stamens ca. 2 × 1–2 mm; filaments ca. 0.7 mm, conuate or largely free; anthers off-white, ca. 1.3 mm, truncate; pores apical, elongate and connected to margin of anther by a groove; appendix narrowly fusiform-conic, 5.5–14.5 cm, base...
0.7–2.3 cm in diam., sometimes slightly compressed, glabrous or shallowly corrugate, base glabrous or with some flattened staminodes, separated by grooves, base constricted, apex acute. Fruiting zone at least 5 × ca. 4 cm. Berries dark blue, oval or oval-ellipsoid, ca. 1 × 0.8 cm, 1- or 2(or 3)-seeded. Fl. Mar.

Moist forested valleys, along water, thickets; 300–900 m. Guangxi (Guiping, Rongshui), Yunnan [E and N Vietnam].

The inclusion of *Amorphophallus arnautovii* and *A. pingbianensis* in the synonymy of *A. coaetaneus* has been published and discussed by Hetterscheid and van der Ham (Blumea 46: 279–281. 2001).

In the protologue of *Amorphophallus coaetaneus*, the specific epithet was given in error as “guipingensis” in the figure caption on p. 186.

南蛇棒 nan she bang

Tuber dark brown, globose, ca. 7 cm high, to 8 cm in diam., weighing up to 850 g, developing seasonal offsets; offsets long, rhizomatous, ca. 9 cm, slender, ca. 0.8 cm in diam., not apically thickened. Leaf solitary; petiole background color dark green with a very faint, pale brownish hue overlain with numerous tiny and fewer large, partly confluent, irregular, dark chocolate-brown or grayish spots, 10–95 cm, slender, to 2 cm in diam. at base, longitudinally, shallowly ridged; leaf blade green adaxially, moderately dissected, 10–150 cm in diam.; rachises only winged in distal 1/3; main segments subdichotomous; terminal segments oblong or lanceolate, base long decurrent in most distal ones, other segments narrowly sessile, 10–28 × 4–9 cm, apex acuminate. Inflorescence long pedunculate; cataphylls to 40 cm; peduncle colored as petiole, 30–70 cm, 0.8–2 cm in diam. at base. Spathe shortly convolute at base, outside pale greenish, grayish purple, or white, sometimes to base with whitish spots, or with gray-green or pale olive-brown spots, either only margin purplish red or also large parts reddish brown, inside pale greenish white with several irregular, purplish red spots and a purplish red margin, base inside often purplish red, or utmost base whitish, ovate or elliptic-ovate, concave, 7–26 × 4–16 cm, apex acute or obtuse, glabrous. Spadix white or with some pale brownish spots and a pinkish hue, much shorter than spathe, stipitate, 4–11 cm; stipe 0.2–1.5 cm, slender; flowers unisexual; female zone cylindrical or slightly obconic, 1.3–3.5 cm, 0.8–2 cm in diam. (including styles), flowers congested; ovary dark purple with pale whitish green base, globose, depressed, or subpyriform, orbicular, diamond-shaped, or irregularly angulate in cross section, 1–2 mm high, 1.5–2(–3) mm in diam., ± gradually tapering to style but after fertilization developing an annular articulation, 1-loculed, occasionally 2-loculed, with 1 basal ovule per locule; style straight or ± strongly curved toward spadix axis, entirely dark purple or apical half bright pale green, slender, cylindrical or slightly conic, apiculus oblique and sometimes tricuspidate or drawn out in a slender point reaching beyond stigma, 2–4 mm, ca. 0.8 mm in diam. at base; stigma subapical or lateral, superficial or subcapitate, usually transversely bilabiate, rarely longi-
tudinally oval, shallowly but densely verrucate or echinate, occasionally with elongate, fleshy, conic verrucae, pale yellowish or dirty whitish, 0.5–1 mm in diam., 0.2–0.5 mm high; male zone cylindric to fusiform-obconic, 1.3–4 × 0.7–2.2 cm, flowers densely congested; male flowers consisting of 3–5 stamens; stamens 3–3.5 mm; filaments 1.8–2 mm, proximal half connate, whitish; anthers whitish, pinkish, or flesh-colored, elongate, subquadangular or strongly biconcave in cross section, 1.3–1.5 × 1–1.3 mm, apex truncate; connective pale violet, massive; pores transversely elongate, lateral; appendix hardly to distinctly stipitate, globose, ovoid, elliptic, or conic, obtuse or truncate, at first turgid but during female anthesis weakening quickly and soon shriveling and drying, turning brown, 1–5 × 1–3 cm, with several irregular grooves (not associated with staminodes), longitudinal ones deepest, between usually with a complex and dense pattern of elongate, convolute staminodes, separated by narrow grooves, whole appearing brainlike, yellowish white or pale grayish green, occasionally with a pale violet hue; stipe of appendix cylindric or obconic, 0.1–0.6 × 0.3–1 cm. Infructescence cylindric, ca. 4 × 2 cm. Berries at first green, maturing orange, elliptic, 1- or 2-seeded. Fl. Mar.–May, fr. Apr–Jun.

Shaded places in primary evergreen forests, on granite bedrock; 800–1700 m. Guangxi, SE Yunnan [N Myanmar, N Thailand].

南蛇棒 nan she bang

*Amorphophallus mellii* Engler; *A. odoratus* Hetterscheid & H. Li.

Tuber dark brown, subglobose or depressed globose, to 10 cm high, to 12 cm in diam., developing numerous offsets annually, these shortly narrowly fusiform, 1–3 × ca. 1 cm. Leaf solitary; petiole green or grayish green with numerous elongate, confluent, pale green or brownish green spots, 30–60 × 1–1.5 cm, glabrous; leaf blade to 100 cm in diam., rachises winged throughout; leaflets dark green adaxially, elliptic-lanceolate, 3–21 × 1.5–7 cm, acuminate. Inflorescence solitary, long pedunculate, producing a scent of fresh carrots; peduncle colored as petiole, 20–60 cm, 0.7–1.8 cm in diam. at base. Spathe shortly convolute at base, outside bright pale green, basally with rounded white spots, these distally grading to whitish green, inside base or a larger patch reddish purple, remainder and limb as outside but paler, broadly ovate, strongly concave, 8.5–24 × 8.5–23 cm, base within ridged-verruculose, apex acute, over-arching spadix. Spadix stipitate or rarely nearly sessile, slightly shorter than spathe, 8–20 cm; stipe colored as peduncle but much paler, 0.5–1.5 cm; female zone cylindric, distal part occasionally broadened, 0.5–2.5 × 1–2.2 cm, flowers congested; ovary pale green, depressed, angulate in cross section, 1–1.5 mm high, 2–3 mm in diam., 2- or 3-loculed, with 1 basal ovule per locule; style pale green, 0.5–1 × 0.8–1 mm; stigma yellowish, flattened, ca. 1 mm high, ca. 2 mm in diam., 2- or 3( or 4)-lobed, oval or triangular in cross section, scabrous-verrucate, lobes obsolete; male zone broadly fusiform, 1.8–3 × 1.3–3.5 cm, flowers congested; male flowers consisting of 4 or 5 stamens; stamens ca. 3 mm; filaments ca. 1.5 mm, basal 1/3 connate; anthers butterfly-shaped in cross section, ca. 1.5 × 1.5–1.8 mm; pores elongate, apical but near margin, sometimes connected by
an eccentric groove; pollen striate; appendix ivory-white, narrowly to broadly conic, usually slightly dorsiventrally compressed, occasionally substipitate, variable, hollow, 3–14 cm, 1.3–4.5 cm in diam. near base, glabrous or entirely echinate or verruculose, or only distal 1/3 so, base constricted and sometimes grooved, apex subacute or obtuse. Inflorescence: fruits zone cylindric, ca. 12 × 5 cm. Berries crowded, shortly stalked, glossy dark blue, elongate, to ca. 1.8 × 1.5 cm.

- Guandong, Guangxi.

H. Li (in FRPS 13(2): 92–95. 1979) treated *Amorphophallus dunnii* and *A. mellii* separately, but the descriptions indicate to Hetterscheid that they represent one variable species. The placement of *A. mellii* as well as *A. odoratus* in the synonymy of *A. dunnii* was explained by Hetterscheid (Blumea 46: 281. 2000).

红河蘑芋 *hong he mo yu*

Rhizome horizontal, brown and green, to ca. 25 × 5 cm, branching infrequently, internodes 1–1.3 cm, leaf scars transversely oval; offset tubers long lasting, depressed, broadly attached; roots mainly developed from ventral side. Leaves solitary or paired or simultaneous with inflorescence, latter emerging from petiole sheath; petiole moderately glossy, background color dirty grayish green but nearly totally hidden by large, oval, confluent, reddish brown spots, 40–60 × 1–1.5 cm, turgid, glabrous; leaf blade 50–70 cm in diam., anterior segment less strongly developed than posterior ones; rachises short, unwinged except for distalmost parts; leaflets paler green abaxially, moderately glossy green adaxially, lanceolate, 8–32 × 2.5–7 cm, margin crispate-undulate, apex acuminate; venation quite strongly impressed. Inflorescence solitary or with leaf, long pedunculate; peduncle reddish brown to yellowish brown, densely rucae; venation strongly impressed. Spadix emitting a strong cheesy smell, often accompanied by all possible transitional stages from adjacent zones; appendix pale or dark brown, hollow after anthesis, apex ± obtuse, all ± cream-colored with a faint bright greenish hue, base with flattened staminodes separated by shallow grooves, distally diminishing, remainder glabrous; male flowers consisting of ca. 4 stamens; stamens 1.5–1.8 mm; filaments whitish, ca. 0.3 mm, basally connate; anthers dark pink to purplish, 1.2–1.5 × ca. 1 mm, truncate, pores elongate, apical; pollen irregular, in tetrad, psilate to verrucate.

Secondary forests; below 1100 m. SE Yunnan [N Vietnam].

台湾蘑芋 *tai wan mo yu*

*Amorphophallus niimurae* Yamamoto.

Tuber dark brown, depressed globose, 2–6 cm high, 3–11 cm in diam., weighing up to 500 g, seasonally producing several globose offset tubers, these 0.5–1 cm in diam. Leaf solitary; petiole dull or moderately glossy, mid- or dark green with several ± oval or irregular, whitish spots, with or without numerous small, white dots in between, 30–60 cm, near base 1–2 cm in diam., glabrous; leaf blade moderately or highly dissected, 30–100 cm in diam.; rachises narrowly winged; leaflets abaxially pale green, adaxially mid- or dark green, dull or glossy, margin at first reddish pink, later usually turning green or whitish, elliptic-ovate, elliptic, or lanceolate, 4–26 × 1.5–5.5 cm, apex acuminate or long acuminate; major veins strongly impressed. Inflorescence solitary, short; pedunculate; peduncle colored as petiole, 4–20 × 0.8–1.5 cm, lengthening in fruit. Spathe strongly convolute at base, outside glossy pale green, with or without a purplish flush, with or without a few small, paler spots; inside dark maroon, near constriction dirty whitish or greenish purple, campanulate, constricted between base and limb, broadly triangular-ovate, 9–25 × 8–23 cm, thickly walled, apex acute or obtuse; limb horizontal, irregularly wavy, outside pale green, with a variable, pinkish purplish hue, maroon near margin, inside dark maroon, dull or glossy, near margin greenish or pale purplish, base within densely covered with large, irregular verrucae; venation strongly impressed. Spadix producing a smell of decaying meat or cow dung at female anthesis, sessile, longer than spathe, 20–52 cm, female and male zones contiguous or separated by a short (ca. 0.5 cm) (partly) sterile zone; female zone cylindric or slightly conic, 1.5–4 cm, 2–3 cm in diam. (including styles), flowers congested or all or partly ± remote; ovary: base or larger part greenish, rest dark purple, depressed, orbicular or suborbicular in cross section, 1.5–3 mm high, 2–3(–4.5) mm in diam., 2-loculed, with 1 basal ovule per locule; funicle long, strongly coiled; style brownish purple or blackish, 2–3 mm, slender, 0.8–1.2–(1.5) mm in diam.; stigma grayish purple, large, orbicular or oval in cross section, 0.8–1.5 mm high, ca. 2 mm in diam., 2– or 3(4) lobed, densely scabrous-papillate; lobes conic, obtuse or subacute; sterile zone with variously transformed male flowers (staminodes), sometimes intermixed with a few sterile remnants of bisexual flowers, often accompanied by all possible transitional stages from adjacent zones; appendix pale or dark brown, narrowly fusiform, 15–42 cm, 1.4–3 cm in diam. near base, 1.8–4 cm in diam. ca. 1/3 from base, oval in cross section, thinly walled and hollow after anthesis, apex ± obtuse or acute, with regular or
irregular, shallow, strongly wrinkled and/or with elongate depressions, these in basal half of appendix with or without a short, pale or dark purplish or whitish hair (0.5–2.5 mm); sterile flowers (when present) between male and female zone either pale green or purple, to 5 mm, hairlike, or reduced bisexual flowers, these consisting of a reduced pistil surrounded by several stamens; male zone ± obconic, 1.5–4.5 cm, 0.9–1.9 cm in diam. at base, 1.5–3.5 cm in diam. at apex, flowers congested or proximal ones distant, free or in distal part fused into low-angled spirals; male flowers consisting of (2 or)3–6 stamens; stamens ivory-white, oval in cross section, ca. 2 × 1.8 mm; filaments ca. 1 mm, basally connate; anthers ca. 1 mm, truncate or rostrate (elongation of connective); connective minutely verrucate, after anthesis more strongly rostrate by differential shrinking of lateral sides of anthers; pores apical, elongate prior to anthesis, opening by deepening of lower margin, after anthesis ± laterally displaced. Berries blue or violet, elliptic.

- Broad-leaved forests, mixed forests, bamboo plantations, orchards, in heavily to lightly shaded places, on thin soils on limestone bedrock or in karst areas; sea level to 700 m. Taiwan.

密毛蒟蒻 mi mao mo yu

Tuber whitish, turning grayish brown upon exposure, globose or depressed globose, 2–9 cm in diam., weighing up to ca. 1500 g, seasonally producing numerous thin, rhizomatous offset tubers, these to 3 × ca. 1 cm. Leaf solitary; petiole dark green with numerous tiny; blackish green spots or with larger, ± diamond-shaped, pale grayish green spots, these filled with numerous dark green, elongate dots, 20–100 cm, 1–2.6 cm in diam. at base, turgid, glabrous; leaf blade 30–120 cm in diam., highly dissected; rachises only in distal half of blade winged, wings sinuous; leaflets adaxially dark emerald green with a pinkish violet margin, ± obovate or elliptic-ovoid, 5.5–11 × 2.5–4.5 cm, ± fleshy, long acuminate; venation impressed adaxially. Inflorescence solitary, long pedunculate; peduncle colored as petiole, 38–125 cm, 1–4 cm in diam. at base. Spathae strongly convolute at base, outside pale green, faintly flushed with purple or dark grayish green with numerous pale whitish green spots, proximal ones confluent, veins dark green, inside blackish maroon, campanulate, constricted between base and limb, broadly triangular, 13–53 × 12–45 cm, covered with numerous shortly ridgelike, laterally compressed, fleshy warts, base obliquely urceolate, thickly walled, apex acute; limb horizontally spreading or obliquely upturned, outside pale green, flushed with purple-brown or dark grayish green with angulate, whitish green spots and margins dirty purple, without spots, inside ± maroon, flushed with green or with numerous small, rounded, sometimes confluent, whitish green spots, veins maroon, margin undulate. Spadix emitting a strong smell of old socks or strong compost, ± stipitate, much longer than spathe, 31–88.5 cm, stipe 0.2–1 cm, female and male zones separated by a narrow sterile zone; female zone slightly obconic or cylindrical, 1.6–6.5 cm, 1.1–3.5 cm in diam. at base, 1.2–3.7 cm in diam. at apex, flowers lax; ovary; basal half white, apical half blackish maroon, ± globose, ca. 2.5 mm high, ca. 2.5 mm in diam., orbicular in cross section, ± gradually tapering to style, 2-loculed, with 1 basal ovule per locule; style maroon, thick, ca. 1 × 1.5 mm; stigma ± pyramidal, orbicular in cross section, ca. 1.8 mm high, ca. 2.5 mm in diam., shallowly 2(or 3)-lobed, lobes pale olive-green, rounded, scabrous; sterile flowers between male and female zone consisting of 1–7 staminodes, these consisting of a swollen, often depressed, white base and a purple hair 5–10 mm; male zone urceolate, terete or slightly laterally compressed, distal margin straight or very irregular, 3–9 cm, 0.9–3.7 cm in diam. at base, 2–7 cm in diam. at apex, flowers congested, with scattered, purple hairs between; male flowers consisting of 3–6 stamens; stamens very shallowly hemispheric, ca. 2 mm, some uppermost stamens intermediate with hairs on appendix, carrying a short hair on connective or reduced to a slightly concave, broad base, carrying a hair (staminode); filaments short, ca. 0.5 mm, connate; anthers ca. 1.5 × 3–3.5 mm, polygonal in cross section, apex very shallowly rounded, ivory-white, producing a clear fluid from top during female anthesis; connective brownish; pores apical, elongate, ovate after anthesis; appendix very narrowly conic, 25.5–73 cm, 2–7 cm in diam. at base, entirely purple or with numerous dirty greenish, small spots, with numerous laxly disposed hairs, these directed perpendicular to appendix axis, 0.2–1.5 cm, purple, in shallow pockets, base not swollen, apex obtuse, producing a clear fluid during female anthesis.

- Dense grasslands; below 100–100 m. Taiwan.

8. Amorphophallus kachinensis Engler & Gehrmann, Pflanzenr. 48(IV . 23C): 91. 1911.

勐海蒟蒻 meng hai mo yu

Amorphophallus bannaensis H. Li.

Tuber brown, depressed globose, 3–5 (or more) cm high, 5–30 cm in diam., developing offsets; offsets incompletely known but probably rhizomatous. Leaf solitary; petiole dirty white with dark green to reddish brown spots, ca. 20 cm (?or longer), glabrous; leaf blade to 100 cm in diam.; leaflets elliptic, 6–9 × 2–3 cm, acute-acuminate. Inflorescence solitary, long pedunculate; cathysyllis 9–20 cm; peduncle ivory-white, grayish, or greenish with brown or purple blotches and greenish patches, 24–80 cm, 0.7–1 cm in diam. at base. Spathae strongly convolute at base, outside green or greenish brown with green spots or purplish red stripes and spots, apex purple, concave, 8–29 × 7–14 cm, base inside with scattered, shallow, punctiform warts. Spadix emitting an unpleasant, rancid smell, much shorter than spathe, 6.5–18 cm; stipe 0.2–1 × 0.4–1 cm; flowers bisexual; female zone slightly obconic or cylindrical, 1.3–5 × 0.6–1.4 cm, flowers congested, proximal ones often more loosely arranged; ovary dark purple, globose or subpyriform, after anthesis (?fertilization) articulate to style, ca. 2 mm high, ca. 1.5 mm in diam., 1-loculed, with 1 basal, anatropous ovule; style strongly curved, dark purple, 1–2 mm, slender; stigma superficial, semiglobose, triradiate or flattened, subapical, often transversely expanded beyond style and subbilabiate, ca. 0.4 mm high, 0.7–1 mm in diam., verrucate, verrucae sometimes elongate and “catcher”-like; male zone obconic, occasionally fusiform, base often constricted, flowers congested, 2–4 × 1.2–3 cm; male flowers consisting of 3–6 stamens; stamens ca. 3 mm; filaments ca. 2 mm, basal half connate, occasionally entirely connate; anthers white, 1–1.5 × ca. 0.8 mm, apex subtruncate; pores api-
cal to sublateral, marginal, elongate; appendix stipitate, occasionally sessile, dirty white, ovoid or conic, occasionally nearly globose, 5.5–7 × 2–4 cm, often with a few deep, longitudinal grooves or with a few shallow folds, glabrous, base constricted, apex truncate, rounded, or rarely acute; stipe 0.3–1.5 × 0.8–2 cm. Fl. Mar–May.

Dense climax forests, on limestone rocks; 1000–1500 m. S and W Yunnan [Laos, N Myanmar (Kachin State), N Thailand].

东亚蘑芋 dong ya mo yu

Tuber depressed globose, to ca. 20 cm in diam., to ca. 12 cm high, [no offset development (Japanese specimens) or] with a few sessile, globose offsets (mainland Chinese specimens). Leaf solitary; petiole glossy, dirty olive-green or grayish green, 2-lobed-sinuous, slightly oval in cross section, ca. 0.8 mm high, ca. 2.5 mm high, ca. 2 mm in diam., 2-loculed; style bright white, ca. 0.5 mm, entirely connate; anthers subtruncate or truncate, mostly subrectangular in cross section, 1–2 × ca. 1 mm; connective brownish; pores apical, elongate; appendix fusiform-conic or narrowly fusiform, 4–16 cm, 1–3 cm in diam. near base, apex acute or obtuse, entirely blackish or with scattered, tiny green spots, or entirely dark greenish, glossy, glabrous or with shallow depressions, base grooved, otherwise naked or with scattered, thin, violet-brown hairs, emerging from depressions, these to ca. 1 cm; pollen striate-areolate, released in strings. Infrescence with dried spathe base sometimes remaining, cylindric, 5–22 × 3–4.5 cm. Berries glossy, at first bright green, turning pinkish purple and finally deep blue, rounded or oval, ca. 1 × 0.8–1 cm, 2-seeded. Seeds oval in longitudinal section, flattened on one side, ca. 8 × 6 × 4 mm; testa black, moderately glossy, minutely rugulose. Fl. Apr–Jun, fr. May–Jul.

Shaded, semishaded, or sun-exposed places, plantations, secondary forests, mixed bamboo and broad-leaved forests, orchards; 300–900 m. Anhui, Fujian, Guangdong, Hunan, Jiangxi, Taiwan, Zhejiang [S Japan].

花蘑芋 hua mo yu

Amorphophallus mairei H. Léveillé; A. namus H. Li & C. L. Long; A. rivieri Durieu ex Riviere; Brachyspatha konjac (K Koch) Koch; Hydrosme rivieri (Durieu ex Riviere) Engler; Proteinophallus rivieri (Durieu ex Riviere) J. D. Hooker.

Tuber brown, slightly glossy, depressed globose, to ca. 20 cm high, to ca. 30 cm in diam., seasonally producing numerous long rhizomatous offsets with swollen apical part, these to ca. 50 × 3 cm. Leaf solitary; petiole background color dirty whitish pinkish or dirty cream-colored, often nearly entirely covered by large, elongate, dark green confluent spots and smaller white dots, or with numerous small, blackish green spots, very variable, to ca. 100 × 8 cm, glabrous or with scattered punctiform warts at base; leaf blade highly dissected, to ca. 200 cm in diam., rachises narrowly winged; leaflets dull green adaxially, elliptic, 3–10 × 2–6 cm, acuminate. Inflorescence long pedunculate (rarely short); peduncle colored as petiole, to ca. 110 × 5 cm. Spathe outside base dirty pale brownish with blackish green spots, or dirty pale whitish grayish with a few scattered blackish green dots, near margin flushed with purple; inside base maroon with or without a paler whitish purplish zone above, elliptic-lanceolate to broadly ovate-triangular, 10–60 × 10–55 cm, base and limb ± separated by a shallow constriction, margin ± strongly sinuous, apex acute; base within densely verrucate, verrucae tiny, punctiform; limb erect, outside uniformly dark purplish brown, or with scattered blackish green spots, inside uniformly dark brown, glossy, undulate and/or longitudinally folded, basal margin spreading. Spadix during female anthesis producing a strong smell of rotting meat and producing small, clear, slightly viscous droplets, sessile, 15–110 cm; female zone cylindric or narrowly conic, 2–11 cm, 1–4 cm in diam. at base and to ca. 6 cm in diam. at apex, flowers congested or distant; ovary whitish or pale pinkish, apex purplish, depressed globose, oval or suborbicular in cross section, 2–2.5 mm high, 2–4 mm in diam., 2- or 3-loculed; style purplish, 1–5
mm, ± slender, 0.7–1 mm in diam., often distinctly branched at apex; stigma dirty yellowish brown, depressed, strongly undulate, often dirty between enlarged style branches, 2- or 3(or 4)-lobed, oval or triangular in cross section, ca. 0.5 mm high, 1.5–2 mm in diam., verruculose-scarious; transitional zone between female and male zones occasionally with partly staminodal male flowers and/or pistillodial female flowers or flowers showing all intermediate stages; male zone cylindric, slightly fusiform, or slightly obconic, 2–12 × 1–6 cm, flowers congested; male flowers consisting of 3–5 stamens; stamens 2–2.5 mm; filaments pale orange yellow or whitish, 0.5–1 mm, basally or entirely connate or slightly diverging at apex; anthers dirty whitish grayish, or ± cream-colored, truncate or subtruncate, 1–1.5 × 0.8–2 mm, rectangular in cross section; connective purplish, turning grayish at anthesis, slightly raised; pores apical, oval or reniform; appendix narrowly fusiform-conic, often laterally compressed and with irregular, shallow longitudinal furrows, 10–85 × 1.5–6 cm, acute, dark purplish brown or paler, densely rugulose, base often with several diamond-shaped, flattened staminodes. Fl. Apr.

- Open situations or forest margins and thickets, secondary forests; 200–3000 m. Yunnan.

The species occurs wild in Yunnan; other occurrences are regarded as plants escaped from cultivation. It is an important crop plant, also cultivated in Japan.

西盟蘑芋 xi meng mo yu

*Amorphophallus sutepensis* Gagnepain; *A. ximengensis* H. Li.

Tuber dirty pale yellowish, brownish, or orangish, yellow inside, globose, sometimes slightly subcylindric, with a deep central depression, 4–8 cm high (or more), 5–25 cm in diam., weighing up to 750 g (or more), seasonally developing several offsets; offsets rhizomatous, long and thin, 2–27 × 0.4–1 cm, apically slightly thickened or not. Leaf solitary; cataphylls 3, to 25 cm, proximally pale pink, distally grading into off-white, covered with pale blackish green, elongate spots; petiole background color pale green, at base often pale pink or with a reddish brown or reddish hue, with many smaller and larger, partly or nearly entirely confluent, elliptic to narrowly elliptic, blackish green or paler green or rarely redish brown spots and several small, white dots, intensity of color and extension of pattern variable, 20–190 cm, 1–5 cm in diam. at base, glabrous; leaf blade 100–200 cm in diam.; rachises broadly winged; leaflets paler green abaxially, green or grayish green adaxially, lanceolate to elliptic-lanceolate, more rarely elliptic, 11–48 × 2–11 cm, base deciduous, apex acuminate. Inflorescence solitary; peduncle colored as petiole but smaller, 25–100 cm, 0.8–2 cm in diam. at base. Spathe erect, convolute at base, outside pale green, toward base slightly darker, inside pale yellowish green, base sometimes ± maroon, cymbiform, ovate to ovate-lanceolate, 11–40 × 6–26 cm, basal convolute part 4–6 cm, base inside with many small, slightly elongate or irregularly ridge-shaped warts, apex acute-acuminate. Spadix developing considerable heat at female anthesis and producing a heavy, gaseous, nauseating stench, yellowish white or pale green, nearly as long as spathe, rarely distinctly shorter or slightly longer, 8–35 cm; flowers unisexual, naked; female zone cylindric or slightly obconic, 0.6–5 cm, 0.6–2.3 cm in diam. (including styles), flowers congested; ovary pale green, occasionally pale magenta-purple near style base, globose or slightly depressed, 1.5–2 mm high, 2–2.5 mm in diam., 1-loced (rarely 2-loced), with 1 basal ovule; style green or magenta-purple, cylindric or conic, 1–2 mm; stigma globose or semiglobose, ca. 1 mm in diam., entire or with a shallow central depression or shallowly 2- or 3-lobed; lobes pale yellowish white, yellow, or brownish, rounded, scabrous, margin sinuose; sterile zone between female and male zones rarely absent, cylindric, 0.6–2 × 0.8–1.8 cm, staminodes congested; appendix fusiform or fusiform-conic, sometimes slightly laterally compressed, 3–17 × 0.9–5 cm, sometimes with a small stipelike part, glabrous, apex rounded or ± acute, base occasionally stipelike, at base sometimes with a few rounded staminodes or staminodal remnants, separated by small grooves; staminodes often with a droplet as on connectives at female anthesis, ivory-white or creamy orange, occasionally flushed with pale purple, ovate or diamond-shaped in cross section, semiglobose, 1–4.5 × 1–3.1 mm in cross section; male zone cylindric-fusiform or slightly obconic, sometimes slightly laterally compressed, 3.5–13 × 0.8–3 cm, flowers congested; male flowers consisting of (1–)2 or 4(or 5) stamens, ivory-white; stamens 2–2.2 mm high; filaments short, 0.75–1 mm, thick, connate, in lowermost flowers greatly enlarged and with reduced thecae, grading into staminodes; anthers with a rounded apex or subtruncate, 1–1.3 mm high, 1–1.75 mm in diam.; pores apical, elongate; connectives often with a clear, slightly sticky droplet at female anthesis. Infructescence cylindric, ca. 10 cm. Berries 1-seeded (rarely 2-seeded), bright red, ca. 1 cm. Seeds silvery gray with small, black dots, elliptic-ovoid, 6–9 × 3–5 mm. Fl. Jun–Aug, fr. Nov–Dec.

Shaded to open, often fire-prone, places in mixed primary evergreen deciduous forests and deciduous dipterocarp forests, forest margins, bamboo thickets, on granite bedrock, sometimes near streams, lowlands; below 1500 m. Yunnan [Bangladesh, Laos, N Myanmar, N Thailand].

This species is used as a food resource by ethnic minorities in China (H. Li, J. Wuhan Bot. Res. 6: 212. 1988, under *Amorphophallus ximengensis*).

膩柄蘑芋 you bing mo yu

*Dractonium paesiifolium* Dennstedt, Schlüssel Hortus Malab. 13: (21, 38). 1818 ["paesiifolium"]; *Amorphophal- lus campanulatus* Decaisne; *A. giganteiflorus* Hayata; *A. microappendiculatus* Engler; *A. paeniifolius* var. *campanulatus* (Decaisne) Sivadasan; *Arum campanulatum* Roxburgh, nom. illeg. superfl.; *A. rumphi* Gaudichaud, nom. illeg. superfl.; *Candarum rumphii* Schott, nom illeg. superfl.; *Hydrosme giganteifora* (Hayata) S. S. Ying.

Tuber dark brown, depressed globose, ca. 20 cm high, to ca. 30 cm in diam., weighing up to ca. 15 kg; root scars prominent, annulate; offsets produced every season, thick and rhi-
zomatos, to ca. 10 × 4 cm. Leaves 1 or 2; petiole background pale to dark green or blackish green, usually with large and small pale blotches and numerous tiny dark dots, large blotches often confluent, especially near base, petiole to ca. 2 m × 20 cm, shallowly corrugate to strongly echiuate-verrucate; leaf blade highly dissected, to ca. 3 m in diam.; rachises narrowly or broadly winged almost to base; leaflets abaxially mid-green or pale green, adaxially mid-green, orbicular, ovate, ovate-oblong, elliptic, lanceolate, or obovate, 3–35 × 2–12 cm, apex acuminate. Inflorescence shortly pedunculate; peduncle 3–20 × 1–8 cm, usually paler and more glabrous than petioles. Spathe campanulate, broader than long, 10–45 × 15–60 cm, and limb often separated by a shallow constriction; limb spreading, background ranging from pale green to dark brown, usually with both large and small, orbicular paler spots, base inside proximal part deep maroon, distal part dirty whitish or very pale pinkish, limb outside as base but with more prominent maroon edges, especially near margin, limb inside usually glossy dark maroon, strongly undulate, base outside very variable, base within densely verrucate, verrucae variable, mostly conic, fleshy. Spadix giving off a stench of rotting meat, sessile, shorter or longer than spathe, 7–70 cm; female zone cylindric, 3–25 × 1–12 cm, flowers congested or slightly distant; ovary entirely pale green or largely maroon with a whitish base, depressed, orbicular in cross section, 1.5–2.5 mm high, 3–5 mm in diam., 2- or 3-lobed; style maroon, 3–15 mm, slender, 1–1.5 mm in diam.; stigma pale or deep yellow, oval or triangular in cross section, large, 3–5 mm high, 4–7 mm in diam., often strongly laterally compressed, then cordate in longitudinal section, verruculose, shallowly or deeply 2- or 3-lobed, lobes rounded or conic, sometimes with a strong groove on outward side; male zone cylindric or strongly obconic, 2.5–15 cm, 1–10 cm in diam. at base, 1–20 cm in diam. at apex, flowers congested; male flowers consisting of 4–6 stamens; stamens 4–6 mm; filaments ca. 0.5 mm, conenate; anthers off-white, cylindric, 3.5–5.5 × ca. 1.5 mm, subtruncate; pollen psilate; appendage very variable, glossy dark maroon, rarely pinkish or yellow, inflated, globose, depressed globose, ovoid, or triangular-conic (pyramidal), 1.5–30 cm, 1.2–30 cm in diam. (slightly above base), minutely granulate, glabrous or with various folds and/or irregular shallow depressions, base often with flattened, staminal nodules, apex obtuse or ± acute. Infructescence long pedunculate; peduncle stretching strongly after fertilization, 20–100 cm, becoming uniformly tan, with very numerous narrow, transverse cracks; fruiting zone cylindric, 10–50 × 3–8 cm. Berries closely set or slightly distant, ripening from green through yellow to bright red, elongate, 1.5–2 cm × 8–10 mm. Fl. Apr–May, fr. Oct–Nov.

Secondary conditions, secondary forests or highly disturbed areas, in dappled shade or fully exposed; sea level to 800 m. Guangdong, Guangxi, Hainan, Taiwan, Yunnan [Bangladesh, India, Indonesia, Laos, Myanmar, New Guinea, Philippines, Sri Lanka, Thailand, Vietnam; N Australia, Pacific islands; naturalized in Indian Ocean islands (Seychelles)].

This taxon is extensively cultivated as a tuber crop, serving as an important food for humans and as animal feed.

東京菔芋 dong jing mo yu

Tuber brown, somewhat glossy, depressed globose, at least 9 cm in diam., root scars slightly raised, no offsets observed. Leaf solitary; petiole uniformly pale green or background pale grayish green with a clear bluish flush near base and on subterranean part, and with whitish spots, these often broader than long, irregularly shaped, and scattered over entire surface with short, longitudinal, blackish dots, these in proximal part often raised, petiole 80–200 × 2.5–7 cm, glabrous, turgid; leaf blade highly dissected, 80–200 cm in diam.; rachises winged only distally from basal main branchings, sometimes some nodes swollen and forming intercalary bulbls; leaflets elliptic-lanceolate to lanceolate, 8.5–24 × 3.5–6 cm, long acuminate. Inflorescence solitary, long pedunculate; peduncle colored as petiole, 22–50 cm (but probably longer), ca. 1 cm in diam. Spathe (all dimensions based on relatively small specimens) shortly constricted at base, erect or arching over spadix apically, outside green with a few transverse, whitish spots, inside whitish green with small, punctiform or slightly elongate verrucae, oval, 8–20 × 5–17 cm, strongly concave; outside limb dark brown with an obscure blackish purplush flush and a few scattered, small whitish dots, inside bright green with a few small, whitish spots. Spadix sessile, shorter than or nearly as long as spathe, 7.5–17 cm; female zone cylindric or slightly obconic, 1–1.5 × 1–2 cm, flowers congested; ovary bright pale green, depressed globose, ca. 2 mm high, 2.5–3 mm in diam., 2-lobed; style whitish, straight, short, 0.8–1 × ca. 0.8 mm; stigma dirty pale yellowish brownish, depressed, large, ca. 1.5 mm high, 2–2.5 mm in diam., orbicular or oval in cross section, verruculose, entire, with an acroscopic shallow depression, or shallowly or distinctly 2-lobed, lobes rounded; male zone slightly or strongly obconic, 1.5–4 cm, 1.5–2 cm in diam. at base, 1.6–3 cm in diam. at apex, flowers congested; male flowers consisting of 4 or 5 stamens; stamens 3–3.5 × 1–1.5 mm; filaments ca. 1.5 mm, conenate; anthers 1.5–2 mm, truncate; pores apical or subapical, elliptic, small, with a groove running from every pore to margin of anther; connective large, raised; appendix conic, oval-elliptic, or narrowly fusiform, 4.5–12 × 2.2–5 cm, obtuse, white, with many shallow, often longitudinally confluent depressions and with or without scattered, tiny, punctiform pustules, base with sterile stamens, gradually merging to form appendix wall. Fl. May.

Dense tropical forests, moist shaded places; 800–900 m. SE Yunnan [N Vietnam].

攸乐菔芋 you le mo yu

Tuber depressed globose, to ca. 10 cm in diam., without offset development. Petiole uniformly olive-green to pale green, 10–75 × 0.5–2 cm, smooth; leaf blade pale green abaxially, mid green adaxially, 10–100 cm in diam.; rachises winged distally from basal branchings, central branching point and several more distal nodes becoming intercalary bulbls, producing new plants after detachment; leaflets elliptic to elongate elliptic, 2–25 × 2–10 cm, apex acuminate, veins impressed adaxially. Peduncle dark olive-green with fine, darker, short striations/
Spadix subsessile, shorter than spathe, ca. 8.5 cm; female zone cylindrical, distal margin very irregular, 1–2 × ca. 1.3 cm, flowers congested or just touching; ovary depressed, orbicular in cross section, 2–2.5 mm high, ca. 4 mm in diam., pale green with very thin, scattered pinkish, short stripes in apical half, 2-loculed, with 1 basal ovule per locule; style ivory-white, short but distinct, ca. 0.8 × 1.1 mm; stomata white, truncate, ca. 1 × 2 mm, rectangular in cross section; pores apical, elliptic, to ca. 2 × 1.5 mm; filaments ca. 1 mm; anthers dirty ivory-white, consisting of 2 or 3 (or 4) stamens; stamens ca. 2 mm; filaments male zone slightly fusiform, 2.5–4 × ca. 11.5 cm, flowers most-in diam., densely verrucate, with a shallow central depression; male zone slightly fusiform, 2.5–4 × ca. 11.5 cm, flowers mostly separated but distally congested, occasional flowers transformed into conic-pyramidal staminodes; male flower consisting of (2 or)3 (or 4) stamens; stamens ca. 2 mm; filaments ivory-white, ca. 0.8 mm, basally connate; anthers dirty ivory-white, truncate, ca. 1 × 2 mm, rectangular in cross section; pores apical, elliptic; staminodes representing one stamen each; appendix ivory-white, broadly conic, massive, 3.2–4 × ca. 1.8 cm, glabrous, base irregular, apex obtuse. Fr. Jun.

- Forest margins, tropical thickets; 900–1100 m. W Yunnan (Longchuan).

This species is cultivated as a food crop in the valleys of the Nanwan and Husa rivers of the Irrawaddy system.

The species status of *Amorphophallus xiei* is doubted by one of us (Hetterscheid). It differs only in color from *A. bulbifer* Blume (N, NE, and S India), an otherwise variable species forming a close relationship with *A. muelleri* Blume (NE India, N Thailand southward to the lesser Sunda islands of Indonesia). Both species also produce the same epiphyllar bulblets unique in *Amorphophallus*. Molecular analysis indicates that *A. xiei* is most closely related to *A. bulbifer*, if not just a somaclonal variant of it (both *A. bulbifer* and *A. muelleri* are apomicts with 2n = 39) taken up for cultivation and possibly escaped to non-agricultural terrain.

滇蘑芋  dian mo yu

*Amorphophallus kerrii* N. E. Brown.

Tuber dark brown, white or yellow inside, depressed globose, to 9 cm high, to 13 cm in diam., weighing up to 500 g, root scars with an annular thickening, seasonally developing several offsets; offsets sessile, rounded or elliptic, to 2.5 to 1.2 cm. Leaf solitary; cataphylls 3, dark grayish green, largely covered with pale pinkish, rhombic spots, 6–35 cm; petiole medium to dark olive-green or dark olive-brown with several rhombic or narrowly elliptic, pale whitish greenish spots, 10–80 cm, 0.5–2.5 cm in diam. at base, glabrous; leaf blade highly dissected, to 190 cm in diam.; rachises broadly winged except below basal branching points, basal branching points sometimes developing intercalary bulblets after disturbance; leaflets abaxially paler, adaxially dark green, often with a bluish sheen when young, margin often narrowly violet, elliptic, 10–40 × 5–13 cm, base broadly decurrent, apex acuminate. Inflorescence solitary, long pedunculate; cataphylls as with leaf; peduncle colored as petiole, 13–60 cm, 1–2 cm in diam. at base. Spatha shortly convolute at base, erect, concave, arching over spadix, outside white or pale greenish white, rarely dark green, sometimes near base with paler, occasionally ringlike spots, or sometimes flushed with pale pinkish, margin sometimes lined pinkish, inside pale greenish white without spots; limb outside dirty creamish, sometimes with faint spots, margin sometimes pale pinkish violet, inside ± cream-colored or pale greenish white, margin sometimes pale pinkish violet, broadly ovate, 9–29 × 4–20 cm, inside base glabrous or with a few scattered, punctiform warts, apex obtuse or acute. Spadix creamy white or pale pinkish, much shorter than spathe, 3–18 cm; stipe pale green with whitish spots, 0.5–2.5 cm; flowers unisexual; female zone acute, ovary depressed, orbicular in outline, 2–2.5 mm high, 2–4 mm in diam., 2-loculed; style straight or curved, green or dirty pale pinkish, narrowly to broadly conic, base

Herbs, tuberous. Cataphylls several. Leaves 2, simple; petiole sheathing; leaf blade hastate-sagittate or sagittate. Inflorescences 1(or 2), pedunculate; peduncle long or short. Spathe ultimately marcescent, convolute, base (tube) separated from limb by a constriction; spathe tube oblong or ovate; limb initially erect, cymbiform, concave or arched, later flopping forward or actively reflexing, ovate-lanceolate to oblong-lanceolate. Spadix sessile, shorter than to subequaling spathe; flowers unisexual, naked; female zone clavate; male zone shorter; stamens 3 or 4, nearly tetragonal, short; connective convex; anthers obovoid, shorter than filaments, opening by an apical pore or longitudinal slit; sterile flowers broadly conic, filiform, ± thickened, verrucose, these between female and male zones recurved, those at distal part of male zone reflexed upward. Berries obovoid, few seeded. Seeds with endosperm; embryo axile.

Twenty-eight species: N Africa, SW Asia extending to C Asia, Europe; one species in China.

1. *Arum jacquemontii* Blume, Rumphia 1: 118. 1836.

Herbs, tuberous. Sprouting in late autumn from a disciform, vertically oriented tuber 2–5 cm in diam., 2–2.5 cm thick. Petiole mid-green, stained dull purple, terete, 10.5–28 cm × 2.5–4.4 mm. Leaf blade dark to mid-green, sagittate to sagittate-hastate, 11–30 × 4–12 cm, apex acute. Inflorescence not scented; peduncle exceeding leaves, pale green proximally, deep green distally, terete, 11–32 cm × 5–7 mm. Spathe 12–22 cm; tube outside green, inside white, oblong-cylindric, 2.5–4 × 1.2–1.6 cm, slightly constricted apically; limb erect at first but soon flopping forward, outside mid-green with faint purple staining, inside dull purple, deeper purple along middle, paler proximally, brownish purple to purple distally, narrowly lanceolate, 9–18 × 1–3 cm, acuminate. Spadix 2/3–3/4 as long as spathe limb, 9–20 cm in total length; female flowers in an oblong-cylindric cluster 15–17 × 5–6 mm; ovary pale greenish yellow, oblong, 2–3 mm; stigma pale grayish mauve; pistillodes in 3 or 4 whorls forming a zone 3–4 mm; bristles glossy deep violet, subulate-filiform, 3–4.5 mm; bases dark purple, bulbiform, ver-}

rulate; staminodes in 2 or 3 whorls forming a zone 3–5 mm; bristles flexuose, glossy deep violet, filiform, 2–2.5 mm; bases dark purple, barely conic, verrucate; interstices: proximal 2.5–3 mm cream-colored, longitudinally ridged; distal 1.5–2 mm cream-colored, smooth; appendix dull yellow to orange-brown, purple, or brownish purple, base paler, cylindric, tapering basally, 6–17 cm × 3–7 mm; male flowers in an oblong zone 6–7 × 4–5 mm; stamens and connectives maroon. Inflorescence cylindric, 4.5–5 × 1.8–2.2 cm. Berries oblong, 4–9 × 3–4 mm. Fl. Apr.–May.

Among rocks in damp soil pockets and crevices, occasionally along damp field edges; 1600–3700 m. SW Xinjiang, W Xizang [N Afghanistan, N India, Kashmir, W Nepal, N Pakistan, Tajikistan, E Turkmenistan, SE Uzbekistan; SW Asia (NE Iran)].

*Arum jacquemontii* has a wide distribution, occurring from the NE corner of Iran to the W Himalayas (Boyce, Gen. Arum, 139, map 17. 1993). *Arum korolkowii* Regel as reported in FRPS (13(2): 100–101. 1979) is, in fact, *A. jacquemontii*. Although similar to *A. korolkowii*, *A. jacquemontii* is readily distinguished by its dull purple, not striped, petioles, the purple spathe limb, longer spadix appendix, and purple, not green, staminode and pistillode bases. Further, the pollen exine of *A. jacquemontii* is spinulose and not scabrous as in *A. korolkowii*. An important geographic difference is that *A. jacquemontii* grows farther south and east and at higher elevations than *A. korolkowii*. 

*疆南星属* jiang nan xing shu

Li Heng (李恒 Li Hen); Peter C. Boyce

Herbs, tuberous. Sprouting in late autumn from a disciform, vertically oriented tuber 2–5 cm in diam., 2–2.5 cm thick. Petiole mid-green, stained dull purple, terete, 10.5–28 cm × 2.5–4.4 mm. Leaf blade dark to mid-green, sagittate to sagittate-hastate, 11–30 × 4–12 cm, apex acute. Inflorescence not scented; peduncle exceeding leaves, pale green proximally, deep green distally, terete, 11–32 cm × 5–7 mm. Spathe 12–22 cm; tube outside green, inside white, oblong-cylindric, 2.5–4 × 1.2–1.6 cm, slightly constricted apically; limb erect at first but soon flopping forward, outside mid-green with faint purple staining, inside dull purple, deeper purple along middle, paler proximally, brownish purple to purple distally, narrowly lanceolate, 9–18 × 1–3 cm, acuminate. Spadix 2/3–3/4 as long as spathe limb, 9–20 cm in total length; female flowers in an oblong-cylindric cluster 15–17 × 5–6 mm; ovary pale greenish yellow, oblong, 2–3 mm; stigma pale grayish mauve; pistillodes in 3 or 4 whorls forming a zone 3–4 mm; bristles glossy deep violet, subulate-filiform, 3–4.5 mm; bases dark purple, bulbiform, ver-

Herbs, seasonally dormant. Underground part a long or short tuberous rhizome. Leaves entire, sagittate-hastate, 3-lobed or -partite. Inflorescence simultaneous with or preceding leaves; peduncle short or long. Spathe divided into a strongly convolute basal part with a ± strong apical constriction and a spreading lanceolate to ovate-triangulate limb. Spadix as long as or longer than spathe, with 4 zones: a proximal female zone, an intermediate sterile zone with staminodes all over (in **Typhonium flagelliforme** only) or only at base, a male zone, and a sessile or stipitate appendix. Female flowers 1-loculed with 1 or 2 (or 3) orthotropous basal ovules. Staminodes variable, spatulate to filamentous or variously reduced. Male flowers with 1–3 stamens opening by slits or pores; connective sometimes prolonged. Fruiting zone with spathe remaining (sometimes splitting open at maturity); berries ovoid, 1 (or 2)-seeded. Seeds with endosperm.

About 50 species: from India to Polynesia; distributions in Africa and the West Indies are the result of human introductions; nine species (four endemic) in China.

The number of species given here for China is expected to be a considerable underestimation in view of the high species numbers in N Thailand and N Vietnam.

Recent molecular investigation of the tribe Areae (Casimano et al, Taxon 59: 439–447. 2010) suggested that **Typhonium** sensu Hetterscheid and Boyce (Aroideana 23: 48–55. 2000) is polyphyletic and transferred several species to **Sauromatum**. The latter genus in its new monophyletic circumscription was not shown to be the direct sister genus to **Typhonium** sensu stricto.

1a. Sterile zone between female and male zone fully covered by staminodes ............................................................ 4. **T. flagelliforme**

1b. Sterile zone between female and male zone with basal staminodes only, rest naked.

2a. Staminodes vermiciform, thin, long, irregularly curving and twisting in all directions.

3a. Staminodes numerous, proximal ones covering most of female zone; spathe limb broadly triangular; underground part a short, tuberous rhizome ........................................................................................................ 9. **T. trilobatum**

3b. Staminodes few, female zone readily visible; spathe limb lanceolate; underground part a long, cylindric rhizome ........................................................................................................................................ 5. **T. hunanense**

2b. Staminodes different, when filiform then not curving in all directions.

4a. Spathe limb broadly triangular, or basal part triangular and apical part lanceolate, purple.

5a. Basal part of spathe limb triangular, apical part narrowed, lanceolate; leaf entire and linear, or deeply 3-lobed, lobes linear .................................................................................................................. 8. **T. trifoliatum**

5b. Spathe limb broadly triangular, not narrowed to apex; leaf entire and triangular to triangular-hastate or triangular-sagittate, or ± deeply 3-lobed, lobes ovate or ovate-lanceolate.

6a. Staminodes downcurved ............................................................................................................................................ 7. **T. roxburghii**

6b. Staminodes upcurved ................................................................................................................................................ 3. **T. blumei**

4b. Spathe limb lanceolate, pale purple or ± cream-colored.

7a. Staminodal flowers present just below base of appendix, a naked axis part between these and male zone, staminodes above female flowers 3-4 mm ........................................................... 2. **T. baoshanense**

7b. Staminodal flowers absent above male flowers.

8a. Staminodes few, all vertical, parallel to spadix axis, 3–4 mm .............................................................................. 1. **T. albidinervium**

8b. Staminodes numerous, at least partly oblique or horizontally spreading, 6–7 mm .............................................. 6. **T. jinpingense**

白脉犁头尖  bai mai li tou jian

Underground part a short tuberous rhizome, ca. 2 cm, producing annual offsets. Petiole pale green or pale dull brownish, 15–25 cm; leaf blade ovate-cordate to ovate-hastate, 4–13 × 3.5–8 cm, base cordate, apex acute. Peduncle 2–5 cm. Spathe outside yellowish green, with reddish stripes and spots, inside ± cream-colored, base ovoid or conic, 1.5–1.8 × 1–1.2 cm, distinctly constricted at apex; limb arching forward, purplish brown or pale brown outside, dark to pale brown inside, margins sometimes ± cream-colored, apex pale green, ovate-lanceolate, 9–15 cm, ca. 1.5 cm in diam. at base, tapering to apex. Spadix ± as long as spathe; female zone conic, 3–4 mm, 3–4 mm in diam. at base; ovary pale green, broadly cylindric, ca. 1 mm; stigma sessile; sterile zone 1.3–2.5 cm, with 2 or 3 whorls of staminodes at base, rest naked and terete; staminodes solitary or 2 or 3 fused with their bases, ± cream-colored to yellowish, base violet or dark pink, fusiform-clavate, 3–4 mm; male zone cylindric, 5–6 × 2–3.5 mm; anthers yellow; appendix brownish purple or pale brown, filiform, 9–16 cm, ca. 2 mm in diam. at base. Infructescence obconic, with spathe base persistent. Berries pale green, obconic, ca. 6 mm. Fl. May.

Guangdong, Hainan; also cultivated in Guangdong and Yunnan [N Thailand].

保山犁头尖 bao shan li tou jian

Underground part a short tuberous rhizome, irregularly...
shaped, ca. 3 × 2 cm, developing several small globose offsets with leaves. Petiole greenish, 8–14 cm, smooth; leaf blade 2–10 × 2–10 cm, variable, ovate, hastate or sagittate to 3-lobed, deeply cordate at base, apex acute; lateral lobes (when present) ovate-oblong, ca. 4.5 × 3 cm. Inflorescence appearing with leaves; peduncle whitish, hidden in soil, 1.3–4.5 cm. Spathepale green outside, ca. 18 cm; tube ellipsoid, ca. 2 × 1.5 cm; limb convolute at base, purple on both surfaces, margins and apical part pale green, lanceolate, to 15 × ca. 3 cm, tapering to apex. Spadix sessile, as long as spathe or slightly longer, 18–20 cm; female zone conic, ca. 5 mm, ca. 3 mm in diam.; stamens yellow; anthers subsessile; appendix narrowly conic, 10–13 cm, ca. 3 mm in diam. at base; ovary yellowish, ovoid; stigma brown; sterile zone to 2.5 cm, basal part with staminodes, rest naked, terete; staminodes yellow, fusiform, 3–4 × ca. 1 mm, obtuse; male zone cylindric, ca. 5 mm, ca. 3 mm in diam.; stamens yellow; anthers sub sessile; appendix dark purple, filiform, ca. 14.5 cm, ca. 3 mm in diam. at base, base with 2 verticils of dysfunctional stamens; sterile male flower at base of appendix subglobose or fusiform, without pollen; anthers yellow; connective purple. Fl. Jun–Jul. 2n = 10*.

About 1700 m. W Yunnan (Gaoligong Shan: Baoshan).

鞭檐犁头尖 li tou jian

Underground part a broad and flattened rhizome, to 5 × 2.5 cm, to 1.8 cm high, producing numerous small, fusiform offsets. Petiole green, 20–40 cm; leaf blade pale green abaxially, green adaxially, entire, cordate-hastate, ovate or deltoid in outline, 7–10 × 7–9 cm, terminal lobe ovate, basal lobes ovate to deltoid. Inflorescence appearing alongside leaves; peduncle pale green, 9–11 cm. Spatha convolute at base, green, ellipsoid to ovoid, 1.6–4 cm × 8–15 mm, distinctly constricted at apex; limb spreading, inside greenish purple to dark purple, ovate, 12–18 × 4–5 cm, long cuspidate. Spadix erect, subequaling spathe; female zone conic, 1.5–3 mm, 3–4 mm in diam. at base; ovary cream-colored; stigma sessile, reddish or pale pinkish; sterile zone 1.7–4 cm, proximal 7–8 mm covered with densely congested staminodes, rest naked, terete; staminodes ascending or variably curved, yellow or basal part reddish, narrowly fusiform, ca. 4 mm; male zone 4–9 mm; stamens yellow, sub sessile; anthers orange; appendix narrowly conic, 10–13 cm, proximally corrugate, distally smooth, tapering to sharply acute apex, base truncate or obliquely truncate, usually with a stipe 5–7 mm. Fl. May–Jul. 2n = 52.

Croplands, grasslands, between rocks; below 1200 m. Fujian, Guangdong, Guangxi, Hainan, Hubei, Hunan, Jiangxi, Sichuan, Taiwan, Yunnan, Zhejiang [Cambodia, India, Indonesia, Japan, Myanmar, Thailand, Vietnam; introduced in Africa, Nepal, Neotropics, Philippines, and Pacific islands].

In FRPS (132): 111. 1979, the name *Typhonium divaricatum* (Linnaeus) Decaisne was misapplied to this species.

鞭檐犁头尖 bian yan li tou jian

*Arum flagelliforme* Loddiges, Bot. Cab. 4: t. 396. 1819; *A. cuspidatum* Blume; *Typhonium cuspidatum* (Blume) Decaisne.

Underground part a short, tuberous rhizome, depressed, 1–2 cm. Petiole green, 15–30 cm; leaf blade 5–25 × 0.5–18 cm, extremely variable, linear, lanceolate, elliptic, or hastate. Inflorescence appearing alongside leaves; peduncle 5–20 cm, thin. Spatha convolute at base, green, ovoid, globose, or depressed, 1.5–3.5 × 1.2–2 cm, constricted at apex, outside with 1 or a few keels; limb convolute-tubular at base, expanded and sharply flexed horizontally at apex, green on both sides or base flushed purple, lanceolate, 7.5–25 cm, tapering to long acuminate apex. Spadix shorter than, as long as, or slightly longer than spathe; female zone subcylindric, slightly fusiform, 1.5–1.8 cm × 8–10 cm; ovoid pale green, elongate, angulate; sterile zone 1–2 cm, entirely covered with staminodes, these distant; staminodes dimorphic; proximal ones ca. 6 mm, with a horizontal white base, apically sharply upcurved, spatulate-lingulate and with or without a purple apex; distal ones downcurved, white, subulate, aristate; male zone ca. 5 mm; appendix sub sessile, 16–17 cm, base swollen and often deeply grooved, apically filiform, erect, horizontal, or downcurved. Berries pale greenish, 2- or 3-seeded. Fl. Apr–May.

In shallow water by streams, water fields, moist meadows; sea level to 400 m. Guangdong, Guangxi, SE Yunnan [Bangladesh, Bhutan, Cambodia, NE and S India, Indonesia, Laos, Malaysia, Myanmar, Philippines, Singapore, Sri Lanka, N Thailand, N Australia].

湖南犁头尖 hu nan li tou jian

Rhizome cylindric, 3–6 cm × 4–10 mm, usually curved and branched. Petiole 11–26 cm; leaf blade green, sometimes purple, oblong-sagittate to ovate, distal part ovate, 6–14 × 5–6 cm, base cordate or truncate, apex abruptly acuminate or acute; basal lobes, if present, spreading, ovate, deltoid, or oblong. Peduncle 6–9 cm, slender. Spatha convolute at base, yellowish, with purple spots, 6–10 cm, basal 2–3 cm ovoid, constricted at apex; limb spreading or slightly recurved, purple, lanceolate, 4–6 cm, apex long acuminate. Spadix shorter than spathe, 5–7 cm; female zone ca. 3 mm; ovary subglobose, 1-loculed, 1-ovuled; stigma sub sessile, violet; sterile zone 1.5–2 cm, proximal 5–7 mm with densely congested staminodes, rest naked; staminodes variously curved, filiform, 3–4 mm; male zone cylindric, 6–8 × 1.5–2 mm; appendix sessile, erect, narrowly conic, 2.3–9 cm × 3–4 mm, base truncate. Fl. Apr–May, fr. Jun.

Bamboo forests, thickets; ca. 100 m. Hunan.

金平犁头尖 jin ping li tou jian

Underground part a short, tuberous rhizome, 2–2.5 × 0.7–1 cm, producing annual offsets. Petiole green, 10–17 × ca. 0.1 cm, smooth; leaf blade cordate, 5–8 × 4–10 cm, base usually cordate-hastate or deeply cordate. Peduncle ca. 1 cm. Spatha pale green, dark purple at apex, base ovoid, ca. 1.5 × 0.5 cm; limb slightly arching, whitish with purple base, narrowly lanceolate, ca. 11 cm, ca. 1 cm in diam. at base, apex long acuminate. Spadix slightly longer than spathe, to ca. 14 cm; female zone ca. 5 mm; ovary with short style and dark purple stigma; sterile zone ca. 2.4 cm, densely covered with staminodes at
base, rest naked; staminodes erect or spreading, yellowish, clavate, 6–7 mm; male zone ca. 5 mm; male flowers yellow; appendix erect, purple, cylindrical, ca. 10 cm × 2 mm. Fl. late Apr–Aug. 2n = 10*.

- Yunnan (Jinping).

7. Typhonium roxburghii Schott, Aroideae, 12. 1855.

金慈姑 jin ci gu

Underground part a short, tuberous rhizome, subglobose or globose. Petiole 10–35 cm; leaf blade yellowish green abaxially, dark green adaxially, reniform-hastate, triangular in outline, shallowly or deeply 3-lobed; terminal lobe ovate, (5–)9–17 × 4–14 cm, acuminate; lateral lobes spreading, obliquely ovate or narrowly ovate. Inflorescence appearing after leaves; peduncle creamy red with dark purple dots, 2–9 cm. Spathe outside whitish or pale green with purple striae, inside purple, base ovoid, 2–3.5 × ca. 1.5 cm; limb outside purplish mixed with dirty green flush or striae, or purple all over, inside deep rich purple, ovate-lanceolate, abruptly tapering from below middle, usually twisted at tip, 13–15 × ca. 5 cm. Spadix subequaling spathe; female zone 4–5.5 mm; ovary white or yellowish, ovoid; stigma purple, 1-loculed, 1-ovuled; sterile zone 1.5–2.2 cm, proximal 5–7 mm densely covered with staminodes, rest naked; staminodes downcurved, yellow or pale yellow, subcylindric, 8–9 mm, acute; male zone 7–12 mm; male flowers consisting of 2 or 3 stamens, yellow; anthers sessile, opening with apical pore; appendix dark purple, narrowly conic, 12–15 cm, 3–4 mm in diam. at base, base truncate with a pale red stipe ca. 2 mm. Berries pale green at first, white when mature, ovoid or ellipsoid, 1-seeded. Fl. and fr. Jul–Aug.

Taiwan, Yunnan [Bangladesh, India, Indonesia, Japan (Bonin Islands), Malaysia, New Guinea, Philippines, Sri Lanka, Thailand; introduced in E Africa, W Australia, and South America].

三叶犁头尖 san ye li tou jian

Underground part a short, tuberous rhizome, ca. 1.5 × 1.2 cm. Petiole 6–12 cm; leaf blade rarely entire and then linear, usually deeply 3-lobed or 3-partite; segments sessile, linear; terminal segment 8–10 cm × 3–8 mm, acuminate; lateral segments horizontally spreading, 1.7–4.5 cm × 3–4 mm. Inflorescence appearing after leaves; peduncle 8–10 cm. Spathe conuplicate at base, dark purple, basally ovoid, ca. 1.5 × 1.2 cm, apex constricted; limb ovate-lanceolate, ca. 17 × 5–6 cm, distal half narrowed, linear, recurved. Spadix shorter than spathe, 13–17 cm; female zone ca. 5 mm; ovary ovoid, 1-loculed, 1-ovuled; stigma disciform; sterile zone ca. 1.4 cm, proximal 1–2 mm covered with staminodes, rest naked; staminodes downcurved, filiform; male zone 8–18 mm; appendix shortly stipitate, suberect, 10–13 cm, base swollen, 3–5 mm in diam., subtruncate. Berries ovoid, 1-seeded. Fl. and fr. Jul–Aug.

- Hebei, Nei Mongol, Shaanxi, Shanxi.

马蹄犁头尖 ma ti li tou jian

Underground part a short, tuberous rhizome, subglobose or subcylindric, producing few annual offsets or splitting up. Petiole green or variously flushed with purple, 25–40 cm; leaf blade cordate-ovate in outline, usually deeply 3-lobed, rarely 5-lobed; central lobe ovate, 10–15 × 6–11 cm, acuminate, sometimes mucronate; lateral lobes 8–13 cm. Inflorescence appearing after leaves; peduncle 5–10 cm, elongating in fruit. Spathe conuplicate at base, outside green, inside green, to 30 cm, ovoid or ellipsoid, 2.5–3.5 × 1–1.5 cm, constricted at apex; limb spreading, outside green, inside dark purple to reddish purple, ovate-lanceolate, ca. 15 × 5–8 cm, apex acuminate. Spadix shorter than spathe; female zone slightly conic, 7–10 mm; ovary yellowish green; stigma sessile, dark or mid-purple, disciform; sterile zone 2–3 cm, proximal half densely covered with staminodes, distal half naked; staminodes strongly curved but mostly directed downward and covering most of female zone, filiform, 7–12 mm; male zone 1.5–2 cm; stamens pink; appendix shortly stipitate, glossy purple or reddish, narrowly conic, 5–12 cm × 4–7 mm, base truncate, apex acute or subacute. Fruiting zone with spathe remaining; berries at first green with purple spots, white when mature, ellipsoid, 1–2-seeded. Fl. May–Jul.

Tropical secondary forests, thickets, grasslands, roadsides; below 700 m. Guangdong, Guangxi, Hainan, S Yunnan [Bangladesh, Bhutan, Cambodia, India, Laos, Malaysia, Myanmar, Nepal, Sri Lanka, Thailand; introduced in W Africa, W Borneo, Neotropics, Philippines, and Singapore].

斑龙芋属 ban long yu shu

Li Heng (李恒 Li Hen); Wilbert L. A. Hetterscheid

Herbs, seasonally dormant. Underground part a depressed-globose tuber. Leaves entire, sagittate-hastate, 3-lobed or -partite to pedatisect. Inflorescence simultaneous with or preceding leaves; peduncle short. Spathe divided into a connate or strongly conuplicate basal part with a ± strong apical constriction and a spreading lanceolate to ovate-triangular limb. Spadix as long as spathe, with 4 zones: a proximal female zone, an intermediate sterile zone with staminodes all over or only at base, a male zone, and a sessile or stipitate appendix. Female flowers 1-loculed with 1 or 2(or 3) orthotropous basal ovules. Proximal staminodes clavate, distal ones (when present) irregularly cristate or elongate aristate. Male flowers with 1–3 stamens opening by slits or pores; connective sometimes prolonged. Fruiting zone with spathe caducous or remaining; berries ovoid, 1(or 2)-seeded. Seeds with endosperm.

Eight species: Bhutan, Cambodia, China, India, Indonesia, Laos, Myanmar, Nepal, Thailand, Vietnam; seven species (two endemic) in China.

See the comment under Typhonium above.
1a. Sterile zone between male and female zones largely smooth and terete or grooved, except for proximal part carrying staminodes.

2a. Leaf and outside of spathe densely hirsute ................................................................. 5. S. hirsutum

2b. Leaf and outside of spathe glabrous.

3a. Spathe base fully closed (margins connate), limb inside with background off-white, almost entirely hidden by numerous strongly confluent, oval, deep maroon spots; leaves always pedate ............................... 7. S. venosum

3b. Spathe base convolute (margins overlapping), limb inside uniformly whitish green, or with purple stripes, or uniformly purple; leaves varying (often in one plant) from entire to pedate ........................................ 2. S. diversifolium

1b. Sterile zone between male and female zones fully covered with staminodes, distally gradually becoming smaller.

4a. Leaves simple, cordate, at least 10 cm ........................................................................ 4. S. giganteum

4b. Leaves pedate.

5a. Spathe base convolute ................................................................................................. 6. S. hoschule

5b. Spathe base fully closed, margins connate.

6a. Proximal staminodes gradually changing upward from clavate through irregularly short and curved to irregularly cristate or strongly reduced to almost absent; petiole often with 1 or a few intercalary bulbils near base .................................................................................. 3. S. gaoligongense

6b. Intermediate staminodes absent between proximal (clavate) and distal (irregularly cristate) staminodes ........................................................................................................................................ 1. S. brevipes

Tuber globose, 1–1.5 cm in diam., producing numerous tiny, annual bulbils. Petiole pinkish or dull purplish red, 15–30 cm × ca. 2 mm; leaf blade green adaxially, 5–9-pedatifid; lobes ± fused at base; central lobe linear-lanceolate or narrowly elliptic, 6.5–25 × 1–5 cm, margin undulate, with or without a purple midrib; outermost lobes progressively smaller. Inflorescence(s) appearing alongside developing leaves; peduncle pale green, 2–2.5 cm. Spathe outside base ocher or yellow-brown with purple spots or faint pinkish spots, inside ± cream-colored or dark pink, closed, subglobose, 1.4–3.5 × 1.5–2.5 cm; limb inside ± cream-colored with a purple zone at apex, base partly closed, partly convolute, margins sinuous, distal part arching and twisting, outside and inside as spathe base, or grayish, lanceolate, 10–15 × 1.2–2 cm. Spadix as long as spathe; female zone cylindric, ca. 6 cm; ovary green or ± cream-colored, depressed obovoid, 2-ovuled; sterile zone 4–6 mm, with a few staminodes at base, rest gloved-ridged and set with irregular, pale purple warts; staminodes clavate, ca. 4 mm; male zone 3–5 mm; appendix pink to yellow, with or without a pinkish base, slender, filiform, 5–14 cm, 0.6–3 mm in diam. at base, apex obtuse. Fl. Jun.

Mountain grasslands; 1500–2700 m. S Xizang [Bangladesh, India (Sikkim), Nepal].

Typhonium diversifolium Wallich ex Schott, Aroidaeae, 13. 1855; Heterostalis foliolaria Schott; T. alpinum C. Y. Wu ex H. Li, Y. Xiao & X. L. Zeng; T. austrotribeticum H. Li; T. diversifolium var. huegelianum (Schott) Engler; T. foliolosum (Schott) Engler; T. huegelianum Schott.

Underground part a subglobose tuber, 1–1.5 cm high, 0.5–1.2 cm in diam., producing annual offsets. Petiole 10–30 cm; leaf blade simple and ovate-lanceolate, 2–22 × 1–25 cm, cuneate to hastate, 3–5-lobed or pedately 5–9-sect, lobes elliptic to linear. Inflorescence appearing just before or alongside leaves; peduncle 3–14 cm. Spathe base oblong-ovoid, 2–4 × 1–2 cm; limb outside green, sometimes flushed with purple or purple all over, inside dark purple or greenish with dark purple veins and flushes, oblong-lanceolate, 4–13 × 2–5 cm, apex acuminate to shortly cuneate. Spadix shorter than spathe, 4–12 cm; female zone cylindric, 0.5–1.5 cm × 4–7 mm; ovary: basal half white, apical half purple, ellipsoid; stigma sessile, white; sterile zone 1–3 cm, base swollen and with long staminodes, rest fusiform, with verrucate staminodal structures; proximal staminodes clavate, with only apical part distinctly and abruptly swollen, basal part filiform, whitish with purple flushes, clavate part yellow with a purple tip or purple; staminodal structures consisting of narrowly elliptic, shallow ridges with verrucate-corrugate surface, white, pale purple, or violet; male zone cylindric, 0.6–1.3 cm × 1.5–7 mm; appendix blackish purple, broadly to narrowly cylindric, 1–7 cm × 2–8 mm, obtuse or subacute.

Open grasslands, meadows, alpine damp open ground; [ca. 2300 m in Bhutan] 3300–4000 m. W Sichuan, S Xizang (Gyirong), NC Yunnan (Dayao) [Bhutan, Cambodia, NE and NW India, Myanmar, Nepal].

Tuber depressed globose, ca. 2 cm high, 2.5–3.5 cm in diam., producing several annual offsets. Petiole uniformly green or dark purple, to 40 cm, proximally often developing intercalary, irregular bulbils; leaf blade deeply 5–13-pedatifid; central lobe elliptic to obovate, to 12 × 5 cm; lateral lobes progressively smaller. Inflorescence appearing before leaves; pe-
dunce largely subterranean, yellowish green with a few scattered purple spots, 4–5 cm × 3–6 mm. Spathe closed at base, outside purplish brown, inside whitish, base triangular-ovulate, to 3 × 2.8 cm, tapering to constricted apex; limb strongly convolute at base, slightly arching, outside brownish purple with a few darker spots, inside pale purple, narrowly oblong, ca. 7 × 2.5 cm, apex long acuminate. Spadix shorter than spathe, ca. 6 cm; female zone cylindrical, ca. 4 × 5–6 mm; ovary obovoid, 1-loculed, 2-ovuled; sterile zone narrowly conic, ca. 3 cm, carrying staminodes in proximal half, these distally progressively shorter and finally disappearing, distally grooved, verruculose; staminodes clavate, distally changing to aristate and upcurved; male zone oblong, ca. 1 cm × 3 mm; male flowers purple, with 1 stamen, petals apiculate; appendix sessile, cylindric, to 6 cm, ca. 5 mm in diam., opening by numerous purple spots, 20–60 cm; leaf blade ovate, cordate at base, base slightly constricted, to hastate, 15–45 × 9–25 cm, margin entire, apex acuminate. Spadix shorter than spathe; female zone broadly cylindrical-conic, to 6.5 × 10 mm; ovary subcylindric, 1-loculed, with 2 or 3 ovules; stigma white or ± cream-colored, disciform; sterile zone to 3.5 cm, proximal 0.5–1 cm densely covered with staminodes, rest naked, grooved; proximal staminodes pale pinkish purple or dark brownish purple, clavate, to 7 mm, apex obtuse; male zone 1–1.7 × ca. 0.8 cm; appendix sessile or sub-sessile, brown or grayish brown, narrowly conic, to 10.5 cm, to 6 mm in diam. at base, base truncate. Inflorescence naked, globose, to 4 cm in diam. Berries with distinct angulate distal part, ca. 1 × 0.5 cm; style remnant sharply acute, ca. 1 mm. Fl. May, fr. Jul.

Secondary evergreen forests, tea plantations; 500–1100 m. S Yunnan [N Thailand].

稚角莲 du jiao lian

Typhonium giganteum Engler, Bot. Jahrb. Syst. 4: 66. 1883; T. giganteum var. giraldii Baroni; T. giraldii (Baroni) Engler; T. stolickzcae Engler.

Underground part a rhizome, 5–8 × 2–5 cm, producing numerous annual fusiform offsets. Petiole green, with or without numerous purple spots, 20–60 cm; leaf blade ovate, cordate to hastate, 15–45 × 9–25 cm, margin entire, apex acuminate. Inflorescence preceding or simultaneous with leaves; peduncle 13–17 cm. Spathe convolute at base, erect, oblong-ovate, 4–8 cm; limb erect or recurved, ovate, to 15 cm, margin sinuous, apex acuminate. Spadix sessile or nearly so, slightly shorter than spathe, to 14 cm; female zone cylindrical, 1–1.5 cm × ca. 8 mm; ovary: basal part whitish, apical part purple, cylindric, apex truncate, 2-ovuled; stigma sessile, gray, disciform; sterile zone 2–3 cm, covered by distant staminodes of different types; proximal staminodes with clavate apical part, middle ones with subulate apical part, distal ones with apical part reduced to a stump; male zone ca. 2 cm × 8 mm; male flowers sessile; anthers ± cream-colored, with pinkish flushes, ovoid, opening by apical pore; appendix sessile, cylindric, to 6 cm, ca. 5 mm in diam. at base, base slightly attenuate, apex obtuse. Fruiting zone elongate, naked, ca. 5 × 3 cm; berries crowded, violet-purple, keeled, apex acute. Fl. Jul.

Grasslands, field sides, stream sides, grassy slopes; below 1500 m. Anhui, Gansu, Hebei, Henan, Jilin, Liaoning, Shandong, Shanxi, Sichuan, S Xizang; cultivated in Guangdong, Guangxi, Jilin, and Yunnan as a medicinal plant.

Underground part a depressed-globose tuber, 1.5–2.5 cm in diam., producing numerous annual, subglobose, angulate offsets. Petiole 20–25 cm; leaf blade pedately 5–7-foliolate; leaflets almost sessile; central leaflet elliptic, 7–31 × 2.5–10 cm, apex acuminate; lateral leaflets elliptic, oblique at base, outermost one ca. 2/3 length of central one. Inflorescence appearing alongside first developing leaf; peduncle very short, 1–1.5 cm. Spathe hirsute outside, smooth inside; basal part convolute but lower ca. 1 cm with fused margin, ca. 4 × 2 cm, slightly constricted at apex; limb laterally incurved, lanceolate-ovate, 8–13 × 5–8 cm. Spadix shorter than spathe; female zone broadly cylindrical-conic, to 6.5 × 10 mm; ovary subcylindric, 1-loculed, covered by distant staminodes of different types; stigma white or ± cream-colored, disciform; sterile zone 3.5 cm, proximal 0.5–1 cm densely covered with staminodes, rest naked, grooved; proximal staminodes pale pinkish purple or dark brownish purple, clavate, to 7 mm, apex obtuse; male zone 1–1.7 × ca. 0.8 cm; appendix sessile or sub-sessile, brown or grayish brown, narrowly conic, to 10.5 cm, to 6 mm in diam. at base, base truncate. Inflorescence naked, globose, to 4 cm in diam. Berries with distinct angulate distal part, ca. 1 × 0.5 cm; style remnant sharply acute, ca. 1 mm. Fl. May, fr. Jul.

毛犁头尖 mao li tou jian

Herbs, cormous, with single-celled hairs ca. 0.5 mm. Underground part a depressed-globose tuber, 1.5–2.5 cm in diam., producing numerous annual, subglobose, angulate offsets. Petiole 20–25 cm; leaf blade pedately 5–7-foliolate; leaflets almost sessile; central leaflet elliptic, 7–31 × 2.5–10 cm, apex acuminate; lateral leaflets elliptic, oblique at base, outermost one ca. 2/3 length of central one. Inflorescence appearing alongside first developing leaf; peduncle very short, 1–1.5 cm. Spathe hirsute outside, smooth inside; basal part convolute but lower ca. 1 cm with fused margin, ca. 4 × 2 cm, slightly constricted at apex; limb laterally incurved, lanceolate-ovate, 8–13 × 5–8 cm. Spadix shorter than spathe; female zone broadly cylindrical-conic, to 6.5 × 10 mm; ovary subcylindric, 1-loculed, covered by distant staminodes of different types; stigma white or ± cream-colored, disciform; sterile zone 3.5 cm, proximal 0.5–1 cm densely covered with staminodes, rest naked, grooved; proximal staminodes pale pinkish purple or dark brownish purple, clavate, to 7 mm, apex obtuse; male zone 1–1.7 × ca. 0.8 cm; appendix sessile or sub-sessile, brown or grayish brown, narrowly conic, to 10.5 cm, to 6 mm in diam. at base, base truncate. Inflorescence naked, globose, to 4 cm in diam. Berries with distinct angulate distal part, ca. 1 × 0.5 cm; style remnant sharply acute, ca. 1 mm. Fl. May, fr. Jul.

Secondary evergreen forests, tea plantations; 500–1100 m. S Yunnan [N Thailand].

西南犁头尖 xi nan li tou jian

Underground part a subglobose to depressed-globose tuber, producing annual offsets. Petiole variable in color, uniform, striped, or spotted, ranging from green to purple, 35–60 cm; leaf blade abaxially pale to gray-green, sometimes with scattered reddish purple spots, adaxially mid- to dark rich velvety green, with or without reddish main vein or splashed with golden spots along main vein, pedatisect, 7–13-lobed; lobes elliptic to lanceolate, margin flat or sinuous, entire or occasionally crenate, apex acute. Peduncle 4.5–20 cm. Spathe convolute at base, outside pale or mid-green or dull mid- to dark brown, with or without a few reddish or blackish brown spots or stripes, inside white or whitish green, base ovoid, occasionally with 1 or a few shallow keels, apex ± constricted; limb slightly arching, outside pale or mid-green, dirty greenish, or dirty pale brownish, with or without a few indistinct darker spots, inside whitish, pale green, with or without a few scattered blackish purple spots, ovate to oblong-ovate, cymbiform, 6–17 × 4–6 cm, often keeled at midrib, apex acuminate to caudate. Spadix shorter than spathe; female zone cylindrical or slightly conic, 2.5–10 × 4–8 mm; ovary ovoid to oblong-ovoid, 1-loculed, 1- to 2-ovuled; stigma very small, in a depression of apex of ovary or ringlike surrounding depression; sterile zone...
narrowly fusiform-conic, 2–6 cm, 3–7 mm in diam. at base, entirely covered by staminodes; proximal staminodes with rhombic, flat base and aristate to clamav process, latter strongly bent upward, white, clavate part yellowish green or occasionally dark red; subbasal staminodes exclusively aristate, strongly pointing upward parallel to spadix axis, ± cream-colored; distal staminodes fused into vertical ridges with numerous irregular short processes, often arranged in ridges, white; male zone cylindric, 6–10 × 2–7 mm; male flowers white, distal ones often sterile and subclavate to spatulate or occasionally aristate; appendix subsessile or more distinctly stipitate, cream-colored or more rarely grayish brown with purple spots, cylindric or rarely fusiform, 1.5–4.5 cm × 2–6 mm, slightly tapering to obtuse apex, smooth or strongly corrugate, base attenuate to stipe; stipe sometimes ridged-verrucate. Fruiting zone with spathe base remaining; berries pale green when mature, obovoid to ellipsoid, corrugate and shal lowly grooved.

Evergreen, bamboo, or secondary forests, grasslands, between rocks; 100–300 m. Guangxi, Guizhou, Sichuan, NE, SE, and W Yun nan [Cambodia, Indonesia, Laos, Myanmar, Thailand, Vietnam].

Tuber depressed globose, to ca. 9 cm high and ca. 15 cm in diam., producing numerous annual offsets, these globose or depressed globose. Petiole yellowish green, with rounded pur plish brown spots, 20–100 cm; leaf blade 9–11-pedatifid; central lobe oblong or oblong-elliptic to ob lanceolate, 10–40 × 20–40 cm, acuminate; lateral leaflets elliptic, gradually smaller toward distal end of rachis. Inflorescence appearing before leaves; peduncle greenish white, with or without a few brown spots, 3–7 cm, sometimes elongating during fruiting. Spathe base outside dull dark violet, inside rich reddish purple, ellipsoid, 5–10 × 2–4 cm; limb convolute at base, ca. 10 cm, distally outside as base but slightly darker and with a few violet longitudinal stripes, inside background color yellowish, almost entirely covered by numerous orbicular to elliptic, confluent dark purple spots, lanceolate, 30–70 × 8–10 cm, apex acuminate. Spadix slightly shorter than or as long as spathe; female zone subcylindric, 2–2.5 × 1–1.5 cm; ovary violet or pale purple, obovoid, 2–4-ovuled; sterile zone 8–8.5 cm, proximal 2–2.5 cm sparsely covered with long staminodes, distally grooved and with a few distant conic projections, proximally whitish, distally pale brownish violet; staminodes yellow, clavate, 4–10 mm; male zone 1–2 × 1–1.5 cm; stamens yellow; appendix at first erect, finally recurved, pale brown to pale violet or lead-colored, terete, to 30 cm, ca. 1 cm in diam. at base, obtuse. Fruiting zone globose or subcylindric, naked, to ca. 9 cm in diam.; berries crowded, bright purple, cylindric, 5–10 × 2–4 mm, angulate, apex truncate. Fl. Apr–May, fr. Jul.

Primary evergreen forests, meadows by rivers, secondary thickets, path sides; 1300–2000 m. Xizang, Yunnan [Bhutan, NE and NW India, Myanmar, Nepal; Africa].

半夏属 ban xia shu

*Atherurus* Blume; *Hemicarpus* Nees.

Herbs, perennial, seasonally dormant; tuber cornlike, subglobose, or rhizome cylindric; tubercles usually formed around main tuber, on tuber around base area of petioles, or at rhizome ends; bulbils usually at proximal, middle, or distal part of petioles, sometimes on both petiole and base of leaf blade. Leaves 1–5; petiole green, usually unsptotted, sometimes spotted; sheath fairly long, very short, or nearly absent; bulbils present or absent; leaf blade simply cordate, ovate, oblong, deeply trifid, or trisect, or pedatisect; leaflets oblong-elliptic to ovate-oblong; primary lateral veins of leaf blade or of each leaflet pinnate, forming a submarginal collective vein, with 1 or 2 distinct marginal veins also present, higher order venation reticulate. Inflorescence solitary, appearing with leaves; peduncle green; peduncle short or slightly longer than petioles. Spathe persistent, slightly to strongly constricted between tube and blade (except in *Pinellia pedatisecta*); tube convolute, narrowly ellipsoid to ovate, almost closed within by a transverse septum (except in *P. pedatisecta*), gaping at base; limb arching, gaping, green to purple, oblong-elliptic, boat-shaped, ca. 2 × or more as long as tube. Spadix much longer than spathe; female zone adnate to spathe, separated from male zone by spathe septum (except in *P. pedatisecta*) and by short, free, naked part of spadix axis; male zone free, cylindric, short; terminal sterile appendix long exserted from spathe, often sigmoid, narrowly subulate. Flowers unisexual, perigone absent. Male flowers 1– or 2–4–androus; stamens sometimes united congenitally in pairs or groups of 4, short, laterally compressed; anthers sessile, connective slender, thecae ellipsoid, 2-celled, dehiscing by apical slit, rarely each pollen sac opening by a pore. Pollen extruded in amorphous mass, inaperturate, spherical or subshperoidal, small to medium sized, exine spinulose. Female flower (gynoeccium, pistil) with ovary ovoid to ovoid-oblong, 1-loculed; ovule 1, orthotropous, funicle very short; placentaation basal; stylar region attenuate; stigma small, hemispheric to disciform. Berries green, yellowish green, or whitish, oblong-ovoid. Seeds obnapiiform to ellipsoid; testa irregularly

ARACEAE
verrucose-rugulose or smooth; embryo axile, elongate, or very small and subglobose; endosperm copious. $2n = 26, 28, 52, 72, 78, 104, 115, 116, 128$.

Nine species: E Asia (China, Japan, Korea), with the center of diversity in E China (Anhui, Fujian, Zhejiang); two species regionally naturalized in Australia, Europe, and North America; nine species (seven endemic) in China.

See the recent synopsis of Pinellia by G. Zhu, H. Li and R. Li (Wildenowia 37: 503–522. 2007).

1a. Leaf blade compound, 3-foliolate or petate.
2a. Leaf blade always petate, leaflets 6–11; bulbils absent ................................................................. 9. P. pedatisecta
2b. Leaf blade 3-foliolate or petate with 5 leaflets.
3a. Leaf blade only deeply 3-partite, anterior lobe broadly ovate or ovate-oblong, sessile; bulbils absent .... 6. P. tripartita
3b. Leaf blade trisect, sometimes petate with only 5 leaflets, leaflets oblong or lanceolate.
4a. Petiole lacking bulbils, bulbils emerging only from tuber; lateral leaflets usually bifid ............ 7. P. yaoluopingensis
4b. Bulbils present at petiole below middle, or both at proximal part of petiole and at base of leaf blade .............................................................. 8. P. ternata

大半夏 da ban xia

Tuber depressed globose, irregularly depressed, to 6 cm in diam., with 1–4 stolons 4–7 cm; stolons often bearing globose tubercles 5–10 mm in diam. at end. Leaves 1–4; petiole greenish or flesh-red, 10–60(–70) cm; leaf blade deltoid-ovate to broadly ovate, 6–33 × 4–22 cm, papery, base deeply cordate, apex acuminate; primary lateral veins 5–15 per side. Inflorescence with peduncle shorter than petioles. Spathe erect, greenish or yellowish green, constricted, 5–8 cm; tube funnel-form, 1–2.5 × ca. 0.5 cm; limb broadly lanceolate, 3.5–5 × 0.8–1.2 cm. Spadix longer than spathe; female zone 1.5–2 cm; adnate to spathe; female flowers densely arranged; pistil 0.8–0.9 cm; ovary ovoid, ca. 0.6 × 0.4 mm; style distinct, ca. 0.3 mm; stigma subhemispheric, ca. 0.18 mm in diam., broader than style; sterile zone between female and male flowers 5–10 mm; male zone 5–10 mm; thecal elongate, ca. 0.7 mm, opening by a long slit; appendix pendulous, incurved, filiform, 4–9 cm. Berries pale green to whitish, ovoid. Fl. Sep.

● Secondary forests, rock slopes, fields; below 800 m. Sichuan.

Pinellia polyphylla differs from P. cordata in having a larger tuber to 6 cm in diam., with 1–4 stolons, and petioles without bulbils.

石蜘蛛 shi zhi zhu

Tuber depressed globose, 1–1.5 cm in diam. Leaves 1–3; petiole green or purple, 12–25 cm; leaf blade greenish or purple abaxially, green adaxially, cordate-oblong, cordate-ovate, or cordate to sagittate, 4–25 × 2–7.5 cm, base deeply cordate, apex long acuminate; primary lateral veins 9 or 10 per side; bulbils present at basal part of petiole and at base of leaf blade (apex of petiole), ovoid. Inflorescence including peduncle shorter than petioles; peduncle 6–10 cm. Spathe constricted, (6–)7–9 cm; tube 0.8–1.2 cm; limb curved, lanceolate, 7–8 cm, apex long acuminate. Spadix 8–12 cm; female zone 5–10 mm, adnate to spathe; female flowers densely arranged; pistil 0.8–0.9 cm; ovary ovoid, ca. 0.6 × 0.4 mm; style distinct, ca. 0.3 mm; stigma subhemispheric, ca. 0.18 mm in diam., broader than style; sterile zone between female and male flowers 5–10 mm; male zone 5–10 mm; thecal elongate, ca. 0.7 mm, opening by a long slit; appendix pendulous, incurved, filiform, 4–9 cm. Berries pale green to whitish, ovoid. Fl. Sep.

● Slopes, moist areas by streams; below 1000 m. Chongqing, Hubei (Yichang), SE Sichuan (Xuyong).

Pinellia integrifolia is characterized by its ovate or oblong leaf blades, obtuse or shallowly cordate leaf bases, and petioles lacking bulbils.

The poisonous tubers are used for treating traumatic injuries and gonorrhea.

滴水珠 di shui zhu

Pinellia browniana Dunn.

Tuber depressed globose, 1–1.5 cm in diam. Leaves 1–3; petiole green or purple, 12–25 cm; leaf blade greenish or purple abaxially, green adaxially, cordate-oblong, cordate-ovate, or cordate to sagittate, 4–25 × 2–7.5 cm, base deeply cordate, apex long acuminate; primary lateral veins 9 or 10 per side; bulbils present at basal part of petiole and at base of leaf blade (apex of petiole), ovoid. Inflorescence including peduncle shorter than petioles, 3.7–18 cm. Spathe green, purplish yellow, or violet, constricted, 4–7 cm; tube 1–1.3 × 1–1.3 cm; limb erect or
slightly incurved, elliptic, 3–4.5 × 1.2–3 cm, apex obtuse or acute. Spadix 9–23 cm; female flowers densely arranged; pistil ca. 2.5 mm; ovary ellipsoid-oblong, ca. 2 × 1 mm; style short, ca. 0.3 × 0.5 mm; stigma disciform, 0.6–0.7 mm in diam.; sterile zone between female and male flowers 7–8 mm; male zone 5–7 mm; thecae elongate, ca. 1.8 mm, opening by a slit; appendix violet-green, tortuous, 6.5–20 cm. Berries ovoid. Fl. Mar–Jun, fr. May–Sep. 2n = 26*, 72*.

- Forests, along streams, moist meadows, cliffs, rock debris; below 800 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hubei, Hunan, Jiangxi, Zhejiang.

Pinellia cordata is characterized by its small size and by having bulbils at both the petiole and leaf blade bases.

The poisonous tubers are used for detoxifying viper bites, for treating lumbago and allergic reactions, and externally for treating traumatic injuries, abscesses, neck lymphosarcoma, mastitis, and also for draining pus.

盾叶半夏 dun ye ban xia

Tuber subglobose, 1–2.5 cm in diam. Leaves 2 or 3; petiole 27–33 cm; leaf blade deep green, peltate, ovate or oblong, 10–17 × 5.5–12 cm, base deeply cordate, apex shortly acuminate; primary lateral veins (5 or)6–8 per side. Inflorescence including peduncle 7–15 cm, shorter than petioles; peduncle 5–8 cm. Spathe yellowish green, constricted, 4–5 cm; tube obovate, ca. 8 mm; limb opening, 3–4 × 0.5–0.8 cm, apex obtuse to acute. Spadix 11–13 cm; female zone ca. 0.8 cm, adnate to spathe; female flowers densely arranged; pistil obovate, 2.5–3 × 1.2–1.5 mm; stigma sessile, very small; sterile zone between female and male zones ca. 3.5 mm; male zone ca. 6 mm; thecae elongate; appendix ca. 10 cm. Berries pale green to whitish, ovoid, acute at apex. Seeds globose. Fl. May–Jun, fr. Aug–Sep. 2n = 78*.

- Forests, grassy slopes, on rocks or between rocks. Fujian, Zhejiang.

Pinellia peltata differs from all of the other species of the genus by its subglobose tuber and its peltate leaves, which are ovate to oblong-ovate and shortly acuminate at apex.

闽半夏 min ban xia

Stem an obovoid rhizome, to 3.5 × 1.4 cm; nodes more than 5, swollen; internodes very short, 2–3 mm; annual part rooting; cataphylls 2 or 3, ca. 1.5 cm, long acuminate. Leaves 2 or 3; petiole 10–45 cm, bearing bulbils at base; leaf blade broadly sagittate; anterior lobe deltoid-ovate, 7–13.5 × 4.5–10 cm, apex long acuminate; basal lobes divaricate, subtriangular, 4–7 × 2.5–3.5 cm; primary lateral veins 6 or 7(or 8) per side. Inflorescence including peduncle 8–20(–25) cm; peduncle shorter than petioles, to 14(–15) cm. Spathe reddish to yellowish violet, constricted, ca. 5.5 cm; tube ca. 1.5 × 0.1 cm; limb erect, navicular, lanceolate, 3.5–4 × ca. 1.4 cm. Spadix ca. 11 cm; female zone ca. 1.3 cm with 9 or 10 pistils, adnate to spathe; female flowers densely arranged; pistil ca. 1.2 mm; ovary ellipsoid, 0.7–0.8 mm in diam.; style slender, ca. 0.25 × 0.15 mm; stigma disciform, 0.3 mm in diam.; sterile zone between female and male flowers 5–7 mm; male zone ca. 7 × 3 mm; appendix outcurved, ca. 8 cm, slender. Berries ovoid. Seed 1, ovoid, ca. 0.4 mm in diam. Fl. Apr, fr. Sep.

- Forest margins, on rocks or between rocks, moist places. Fujian.

Pinellia fujianensis is similar to P. cordata but differs in having an acute rhizome to 3.5 cm and leaf blade broadly sagittate.

6. Pinellia tripartita (Blume) Schott, Syn. Aroid. 5. 1835; Aristaea tripartitum (Blume) Engler; Pinellia tripartita var. atropurpurea Makino.

Tuber subglobose, ca. 2.5 cm in diam.; cataphylls lanceolate, to 10 cm. Leaves 2–5; petiole green, 30–35 cm; leaf blade green, 3-partite; leaflets broadly ovate to ovate-oblong; anterior leaflet ca. 15 × 4–7 cm, apex ca. 1.5 cm; lateral leaflets smaller; primary lateral veins 8–12 per side on each leaflet, forming a distinct marginal collective vein, also with 2 thinner collective veins along margin. Inflorescence solitary; peduncle to 25 cm, shorter than petioles, slender. Spathe whitish to light green, slightly constricted, 7–9(–10) cm; tube almost closed within by a transverse septum, gaping at base, oblong to subcylindric, ca. 3.5 × 1–1.25 cm; limb gaping, boat-shaped, oblong, ca. 4 × 2.5 cm. Spadix 20–25 cm; female zone ca. 3 cm, adnate to spathe; female flowers densely arranged; pistil 1–1.2 mm; ovary ovoid, 0.9–1 mm; style distinct, 0.2–0.3 mm, attenuate; stigma sub-hemispheric; sterile zone between female and male zone 0.6–0.7 cm; male zone 1.8–2 cm; thecae elongate, opening by a slit; appendix long exerted from spathe, sigmoid, 15–20 cm, base ca. 3 mm in diam., smooth. Berries pale green to whitish, ovoid, 1-seeded. Fl. May–Jun, fr. Jun–Sep. 2n = 26, 52.

Dense broad-leaved forests, forest margins, roadsides. Hong Kong [Japan].

Pinellia tripartita was considered endemic to Japan for a long time; it is first reported here from Hong Kong (C. Wright 508, P).

This species differs from Pinellia yaoluopingensis in having broadly ovate or ovate-oblong, sessile leaflets and a tuber lacking tuberules. It is also easily distinguishable from P. ternata by its petioles lacking bulbils.

This species is used ornamentally.

鹞落坪半夏 yao luo ping ban xia

Tuber subglobose, 1.3–3 cm in diam., bearing bulbils at apex. Leaves 1–4; petiole deep green, with purple spots, 12–25 cm; leaf blade 3-foliolate, sometimes also pedate; leaflets 3–5; central leaflet oblong-elliptic or obovate-elliptic, 5–10 × 3–4.5 cm, base cuneate, apex acuminate or acute; lateral leaflets sessile, smaller, 5.5–7.3 × ca. 4 cm, with 4 or 5 primary lateral veins per side, forming a collective vein along margin. Inflores-
cences 1 or 2; peduncle usually longer than petioles, 22–36 cm. Spathe green, constricted, 7–8 cm; tube 2–3.5 cm × 6–8 mm; limb oblong, 3–4 × 2–3 cm, apex obtuse. Spadix 16–20 cm; female zone 2–2.5 cm × 3–5 mm, adnate to spathe; female flowers densely arranged; pistil 1–1.1 mm; ovary broadly ovoid, ca. 0.9 mm; style distinct; stigma disciform, ca. 0.25 mm in diam.; sterile zone between female and male flowers 5–6 mm; male zone 5–7 × 3–4 mm; thecae elongate, ca. 1.4 mm, each pollen sac opening by a pore; appendix recurved, sigmoid, green, 13–18 cm. Berries conic, obtuse, 1-seeded. Fl. May, fr. Jul–Sep. 2n = 26*.

- Broad-leaved forests; ca. 1000 m. Anhui (Jingde, Yuxi), Jiangsu (Nanjing).

This species differs from *Pinellia ternata* in having a tuber with tubercles around the petiole bases and by lacking bulbs elsewhere.

半夏  ban xia

*Arun ternatum* Thunberg in Murray, Syst. Veg., ed. 14, 827, 1778; *Arisaema loureiroi* Blume; *A. macrorurum* (Bunge) Kunth; *A. ternatum* (Thunberg) Schott; *Arum atrovires* Sprengel (1826), not Linnaeus (1753); *A. bulbiferum* Salisbury; *A. bulbosum* Persoon ex Kunth; *A. fornicatum* Roth; *A. macrorurum* Bunge; *A. subulatum* Desfontaines; *A. triphyllum* Houttuyn (1774), not Linnaeus (1753); *Hemicarpos fornicatus* (Roth) Nees; *Pinellia angustata* Schott; *P. koreana* K. H. Tae & J. H. Kim; *P. ternata* var. *angustata* (Schott) Engler; *P. ternata* var. *giraldiana* Engler; *P. ternata* var. *subpandurata* Engler; *P. ternata* var. *vulgaris* Engler; *P. tuberifera* Tenore, nom. illeg. superfl.; *Typhonium tuberculigerum* Schott.

Tuber globose, 1–2 cm in diam. Leaves 2–5; petiole 15–20 cm, base sheathing; bulbs present in sheath, at proximal or middle part of petiole, and at base of leaf blade; leaf blade 3-foliolate, sometimes pedate with 5 leaflets; leaflets greenish abaxially, green adaxially, oblong-elliptic or lanceolate, base cuneate, apex acuminate; anterior leaflet 3–10 × 1–3 cm; lateral leaflets (3–)4–7.5 × 1.8–2.3 cm, with 7–9 (or 10) primary lateral veins per side, forming a collective vein along margin. Inflorescence including peduncle longer than petioles, 25–35 cm; peduncle 15–25 cm. Spathe greenish or whitish green, rarely purplish, slightly constricted, 6–7 cm; tube narrowly cylindric, 1.5–2 cm; limb green and usually violet at margin, oblong, 4.5–5 cm. 1.5 cm, apex obtuse or acute. Spadix 9–10 cm; female zone ca. 2 cm, adnate to spathe; female flowers densely arranged; pistil 2.1–2.2 mm; ovary ovoid, ca. 1.8 × 1.1–1.1 mm; style distinct, attenuate; stigma very small, ca. 0.2 mm in diam., not broader than style; sterile zone between female and male flowers ca. 3 mm; male zone 5–7 mm; thecae elongate, ca. 1.2 mm, opening by a slit; appendix erect or sigmoid, green to violet, 6–7 (–8) cm. Berries yellowish green to whitish, ovoid, with persistent stigma and style, 1-seeded. Fl. May–Jul, fr. Jul–Sep. 2n = 28, 54, 72, 104, 115, 116, 128.

Grasslands, secondary forests, wastelands, cultivated lands; below 2500 m. Widely distributed in China, excluding Nei Mongol, Qinghai, Xinjiang, and Xizang [Japan (including Ryukyu Islands), Korea; naturalized in Europe and North America].

*Pinellia ternata* is a highly variable species in morphology and cytology. It differs from other *Pinellia* species by having bulbs at different parts of the petiole; bulbs on each petiole may be 1, 2, or 3. Fourteen sheets of specimens in the Herbarium of the Royal Botanic Garden Edinburgh (E), have been studied and counted: six specimens have bulbs at the proximal part of the petiole; five specimens show bulbs at the median part; one specimen has three bulbs located at the proximal and median parts and at the distal part; another specimen has two bulbs at the distal and proximal parts (6 May 1975, N. Togash *s.n.* from Tokyo); and one has two bulbs found at the distal and the median parts. After examining the variability in position and number of bulbs, we suggest that "*Pinellia zingauiiensis*" H. Li (nom. nud.), with bulbs at both the distal and proximal parts of the petiole, must be a synonym of *P. ternata*. For the same reason, Engler's four variants (*P. ternata* var. *angustata*, *P. ternata* var. *giraldiana*, *P. ternata* var. *subpandurata*, and *P. ternata* var. *vulgaris*) may not represent any independent systematic taxa. *Pinellia koreana* was described from Korea as differing by its pedate leaf blades with five leaflets; but strong growing plants sometimes produce pedate leaf blades, and, therefore, this is only a further synonym of *P. ternata*. It was collected from Korea, Mt. Chiri, 480 m, 10 Jun 1999 (fl.), K.-H. Tae 99-001 (holotype, TUT).

The poisonous tubers are used in traditional Chinese medicine for treating coughs, reducing phlegm, stopping vomiting, and externally for treating mastitis and otitis media. The plant is also used ornamentally.

虎掌  hu zhang

*Arisaema cochinchenense* Blume; *Pinellia cochinchenensis* (Blume) W. Wight; *P. tuberifera* Tenore var. *pedatisecta* (Schott) Engler; *P. warwae* Engler.

Tuber subglobose, to 4 cm in diam., with some surrounding tubercles. Leaves 1–3 or more; petiole greenish, 20–70 cm, proximally sheathing; leaf blade pedate; leaflets 6–11, sessile, lanceolate, base cuneate, apex acuminate; central leaflet 15–18.3 cm, following ones smaller; outermost ones 4–5 cm; primary lateral veins 7–12 per side, forming an inner collective vein and an outer second collective vein near margin. Inflorescence including peduncle 20–50 cm, green; peduncle to 35 cm. Spathe slightly convolute at base, green outside, greenish to whitish inside, lanceolate in total, not constricted between tube and limb, inside transverse septum absent, 10–19 × 1.5–2 cm, apex long acuminate. Spadix 14–20 cm; female zone 1.5–3 cm, adnate to spathe; female flowers very densely arranged; pistil 2.1–2.2 mm; ovary green, obovoid, ca. 1.9 × 1.2–1.3 mm; stigma subsessile, white, spherical, papillose; sterile zone between female and male flowers short, 4–5 mm; male zone cylindric, 5–8 mm; thecae yellow, elongate, ca. 1.3 mm, opening by a slit; appendix suberect, greenish to whitish, ± cylindric, 10–15 cm, 2–3 mm in diam. at base, distally becoming filiform. Berries pale to whitish green, ovoid, 4–5 × 3–5 mm, 1-seeded. Seed brown, obovoid, ca. 3.5 × 2.5 mm; funicle robust. Fl. May–Jun, fr. Jul–Sep. 2n = 26*.

- Forests, valleys, shaded areas; below 1000 m. Anhui, Fujian,
ARACEAE

Guangxi, Guizhou, Hebei, Henan, Hubei, Hunan, Jiangsu, Shaanxi, Shandong, Shanxi, Sichuan, NE Yunnan, Zhejiang.

Pinellia pedatisecta is the only species of Pinellia with always pedate leaf blades and lacking the transverse septum inside its spathe. It is easily distinguished from other species by having a spathe lacking a constriction between the tube and blade.

The poisonous tubers are used in medicine for treating enlarged lymph nodes and urinary tract infections.

天南星属 tian nan xing shu

Li Heng (李恒 Li Hen), Zhu Guanghua (朱光华); Jin Murata

Herbs with tuber or rhizome, paradioecious (sex depending on nutrition and therefore variable from one year to another). Tuber usually renewed seasonally and producing some tubercles around, these separated from old tuber at end of growth season. Rhizome usually cylindric, with many nodes, not renewed every year, usually preceding evergreen or wintergreen leaves. Roots usually growing at apex of tuber around cataphylls or at new nodes of rhizome. Cataphylls 3–5, herbaceous or membranous, surrounding basal part of shoot. Pseudostem consisting of basal cylindric part of petiole present or absent. Leaves 1–3, long petiolate; petiole usually mottled, stout, smooth or verrucose; leaf blade 3-foliolate, palmate, petate, or radiate. Inflorescence borne with or before leaves, solitary, pedunculate, emerging from pseudostem in tuberous or some rhizomatous plants or separately from petiole and directly surrounded by cataphylls in some rhizomatous plants; peduncle (excluding part within pseudostem) erect, stout, usually shorter than or sometimes equaling or longer than petioles (excluding part forming pseudostem). Spathe tubular proximally, expanded limb distally, deciduous, withering or rarely semipersistent; throat of spathe tube often widely spreading outward, with or without an auricle on each side, margins of throat ciliate or not; spathe limb occasionally with a long tail at apex. Spadix sessile, unisexual or bisexual; bisexual spadix female proximally, male distally, neuter (sterile) flowers sometimes present on appendix; appendix variable in shape, base stipitate or not, apex sometimes ending in long filiform flagellum. Ovaries with 1 basal locule with several orthotropous ovules; style usually indistinct; stigma peltate, papillose. Synandria of 2–6 fused stamens, sessile or on a united filament; anthers dehiscing by 2 apical pores or a single horseshoe-shaped slit or circumscissile into a ring. Neuter flowers filiform, subulate. Infructescence upright or nodding. Berries reddish, several seeded.

About 180 species: NE Africa, Asia (including Arabian Peninsula), E North America and Mexico; 78 species (45 endemic) in 12 sections in China; one additional species (endemic) is incompletely known.

Many Chinese species of Arisaema are of medicinal importance. For example, the tuber of A. flavum is used to treat fractures, traumatic injuries, and swellings; the tuber of A. franchetianum is used to treat enlarged lymph nodes, intestinal parasites, and snake and insect bites; the tubers of A. erubescens, A. heterophyllum, and A. yunnanense are used to treat coughs, epilepsy, and tetanus. Many species of Arisaema have been found to possess anticancer properties.

The following taxa were recorded in FRPS but are, in fact, not distributed in China: Arisaema amurense Maximowicz var. serratum Nakai (FRPS 13(2): 174. 1979; A. amurense var. denticulatum (Makino) Engler; A. nikoense Nakai), A. angustatum Franchet & Savatier (p. 171), A. griffithii Schott (p. 148), A. griffithii var. verrucosum (Schott) H. Harra (p. 149; A. verrucosum Schott), A. japonicum Blume (p. 179), A. propinquum Schott (p. 140), A. serratum (Thunberg) Schott var. viridescens Nakai (p. 180), A. sikokianum Franchet & Savatier (pp. 174–175), and A. sikokianum var. serratum (Makino) Handel-Mazzetti (p. 175; A. sazensoo (Blume) Makino var. serratum Makino).

1a. Plant basically evergreen; underground stems rhizomatous, purplish inside; pseudostem absent or present; phylloctaxy spiro-distichous ................................................................. 1. A. sect. Anomala

1b. Plant basically deciduous; underground stems tuberous or rarely rhizomatous, whitish inside; pseudostem present; phylloctaxy spiro-distichous.

2a. Summer dormant; underground stems rhizomatous ................................................................. 9. A. sect. Decipientia

2b. Winter dormant or semievergreen; underground stems tuberous or rarely rhizomatous.

3a. Spadix appendix sessile, or if stipitate then leaf blade radiate.

4a. Phylloctaxy spiro-distichous; leaf blade radiate; spadix appendix sessile or rarely stipitate .... 12. A. sect. Sinarsaema

4b. Phylloctaxy quincuncial; leaf blade 3-foliolate or petate; spadix appendix sessile.

5a. Spadix appendix with neuter flowers at least in female inflorescence, or if not then leaf blade 3-foliolate and spadix bisexual.

6a. Axillary buds solitary; leaf blade trisect ................................................................. 2. A. sect. Fimbriata

6b. Axillary buds accompanying accessory buds; leaf blade pedatisect ................................... 3. A. sect. Clavata

5b. Spadix appendix without neuter flowers, unisexual or bisexual.

7a. Spadix appendix gradually tapered to apex, usually filiform, exserted from spathe, recurved or sigmoid ................................................................. 7. A. sect. Tortuosa

7b. Spadix appendix subglobose, not exserted from spathe ........................................................ 8. A. sect. Dochafa

3b. Spadix appendix stipitate; leaf blade trisect or pedatisect.

8b. Phylloctaxy quincuncial.
9a. Leaf blade palmate or rarely radiate; ovary fusiform .................................................. 11. A. sect. Tenuipistillata
9b. Leaf blade trisect, or rarely palmate; ovary bottle-shaped.
10a. Leaf blade 3-foliolate or palmate; inflorescence exceeding leaf blade ............... 5. A. sect. Nepenthioidea
10b. Leaf blade 3-foliolate; inflorescence below leaf blade.
11a. Appendix apex usually flagelliform, much exceeding spathe, pendulous, proximally thick and base expanded into a stipitate disk; anthers dehiscing by horseshoe-shaped or lunate slits ....................................................... 4. A. sect. Arisaema
11b. Appendix obclavate, nearly erect or slightly recurved, obtuse at apex and gradually narrowed at base into a stipe; anthers dehiscing by rounded or oblong pores ......................................................................................... 6. A. sect. Franchetiana

Plants with rhizome. Rhizome reddish purple inside. Phyllotaxy spiro-distichous. Leaf blade 3-foliolate or pedate, rarely simple. Spadix bisexual or rarely unisexual when mature; appendix sessile, terete, attenuate or long and pendulous distally, usually with numerous filiform neuter flowers.

About 20 species: wet tropical and subtropical Asia; 11 species (seven endemic) in China.

1a. Pseudostem distinct (more than 10 cm).
2a. Leaf blade pedate or rarely 3-foliolate; neuter flowers occurring partly on spadix appendix.
3a. Spathe basically green, throat of spathe tube not auriculate ........................................ 8. A. grapsospadix
3b. Spathe basically green, or dark purple dotted with paler purple, throat of spathe tube auriculate .............................. 9. A. hainanense
2b. Leaf blade 3-foliolate; neuter flowers covering whole of spadix appendix.
4a. Neuter flowers (distal ones) 3–5.5 cm .......................................................... 5. A. victoriae
4b. Neuter flowers less than 0.7 cm.
5a. Rhizome stout, more than 3 cm in diam.; spathe semitranslucent, without white mark .............................. 1. A. petelotii
5b. Rhizome less than 2.5 cm in diam.; spathe opaque, with white mark .................................................. 7. A. rubrirhizomatum
1b. Pseudostem absent or very short (less than 5 cm).
6a. Budlike structure present at axil of neuter flowers ..................................................... 2. A. smitinandi
6b. Budlike structure absent at axil of neuter flowers.
7a. Apex of spadix appendix simple or nearly so.
8a. Spathe tube throat broadly auriculate; spadix appendix with neuter flowers .................. 11. A. bannaense
8b. Spathe tube throat without auricles; spadix appendix without neuter flowers ........... 10. A. petiolulatum
7b. Apex of spadix appendix brushlike, covered with numerous neuter flowers.
9a. Spathe limb basically purplish, tube thick; spadix appendix pendulous ....................... 4. A. lihengianum
9b. Spathe limb basically green, tube slender; spadix appendix upright.
10a. Spathe limb with single white mark at base ......................................................... 6. A. pingbianense
10b. Spathe totally greenish, without marks ........................................................................ 3. A. menglaense

紫根南星  zi gen nan xing

Plants dioecious. Rhizome lying underground or half underground, dark brown outside, purplish in section, thickly cylindric, 7–18 × 4–6 cm. Leaves usually 2; petiole green or purplish green, to 60 cm, proximal 20–30 cm sheathing into pseudostem, encircled by several cataphylls; leaf blade green, 3-foliolate; central leaflet with petiolule 1–4 cm, blade elliptic to ovate, to 30 × 17 cm, base rounded; lateral leaflets similarly petiolulate, obliquely ovate, apex acuminate. Peduncle colored as petiole, 7–12 cm. Spathe green, without stripes, semitranslucent; tube narrowly funnelform, 4–7 cm, throat 2–3 cm in diam.; limb deltoid-ovate, to 7 × 5 cm, apex acute and cuspidate. Spadix bisexual when mature; appendix basically green, 4–6 cm, slender, covered with rather numerous filiform neuter flowers, brushlike. Berries reddish, ovoid, ca. 5 mm in diam. Fl. Jun–Jul, fr. Oct–Nov.

Humid forest floors and gravel slopes in shade; 800–1000 m. S Yunnan [Vietnam].

披发南星 pi fa nan xing

Arisaema tsangpoense J. T. Yin & Gusman.

Plants perennial, evergreen, basically dioecious. Rhizome ca. 5 × 2.5 cm. Pseudostem absent. Leaves 1–4 together; petiole dull dark brown to violet, with light brown transverse markings, cylindric, ca. 25 × 0.5–1 cm; leaf blade pedate with 3–5 segments; leaflets petiolulate, greenish, lanceolate, membranous, apex acute ending in a short arista; central leaflet with petiolule to 3 cm, blade ca. 15 × 5 cm, lateral veins numerous, base cuneate; lateral leaflets with petiolule to 5 mm, blade 12–15 × 3–4 cm, base obliquely cuneate. Peduncle whitish, cylindric, much shorter than petioles, ca. 2 × 0.5 cm, surrounded by 3 cataphylls; cataphylls light brown, oblong, ca. 2, 4, and 6 cm,
respectively. Spathe: tube white-green, with numerous green longitudinal stripes, cylindric, ca. 3 × 1.5 cm, throat margin widely recurved; limb arched over tube, green, with darker longitudinal veins, ovate-lanceolate, ca. 7 × 4 cm, apex acuminate, ending in a tail ca. 1 cm. Spadix unisexual; female zone conic, 13–15 × 5–10 mm; ovaries congested, green, fusiform, with 1 basal locule, each locule containing 3 ovules, fusiform and slightly curved; stigma disciform, borne on a short style; male zone cylindric, ca. 2 × 0.5 cm; stamens loosely arranged, each consisting of 3–6 anthers, stipitate; thecae yellowish, subglobose, dehiscing by oblong pores; appendix sessile, dark green to purple, slender, 15–40 × 1.5–3 cm, covered with numerous ascending filiform neuter flowers throughout its length; neuter flowers in distal section accompanied by an axillary budlike structure. Fl. Nov.

Arisaema smitinandii was recorded from China by H. Li (Aroidaeana 30: 45–48. 2007). The specimens on which this record was based (Mêdog Expedition 1090, KUN [3 sheets]) are paratypes of the name A. tsangpoense J. T. Yin & Gusman (Ann. Bot. Fenn. 43: 156. 2006; and see subsequent discussion by Gusman, Aroidaeana 31: 124. 2008). One of us (Murata) agrees with Gusman (loc. cit.) in recognizing the Chinese plants as a distinct species, A. tsangpoense, unique in having a budlike structure present at the axil of the neuter flowers, whereas no such structure has been described or illustrated for A. smitinandii; furthermore, the peduncle is very short in A. tsangpoense but longer than the pedicel in A. smitinandii. Murata believes that true A. smitinandii and A. tsangpoense are conspecific because they have the same filiform neuter flowers on the spadix appendix. Li also believes that the budlike structure at the axil of the neuter flowers is merely an additional neuter flower and that differences in the number and shape of neuter flowers in Arisaema should not be used to distinguish species.

Moreover, Li notes that variation in pedicellate length is known in other species of Arisaema and, in the case of A. smitinandii, is probably the result of differing climatic conditions in the disjunct areas of the distribution. Li notes a similar disjunction in the distribution of A. cuspidatum Engler, known from the Naga Hills in NE India and from Penang and Selangor in W Peninsular Malaysia. However, P. Boyce (in reviewing this treatment) believes that A. cuspidatum is a junior synonym of A. roxburghii Kunth, which was described from Penang, and that the plant in the Naga Hills is A. album N. E. Brown.

Arisaema menglaense meny la nan xing

Plants perennial. Evergreen, monoecious or male. Rhizome creeping horizontally, purplish to brownish outside, red-purple inside, subcylindric, to 13 × ca. 4 cm, branching. Cataphylls to 20 cm, some encircling peduncle directly. Leaf 1, expanding simultaneously with inflorescence; pedicel purplish brown, mottled with green, to 30 cm, lacking pseudostem; leaf blade 3-foliolate; petiolules 3.5–4.5 cm; leaflets subequal in size, to 25 × 15 cm; central leaflet oblone-elliptic, base rounded-cuneate, apex acuminate and caudate; lateral leaflets oblique. Peduncle 11–20 cm. Spathe tube white or pale green, narrowly funnel-form, 4.5–6 × 7–9 cm when opened; limb proximal half white, distal half red-purple, narrowly deltoid to narrowly deltoid-ovate, 15–20 × 5–6.5 cm, apex acuminate. Spadix bisexual after sex change; female zone 20–30 × ca. 10 mm; female flowers green, bottle-shaped; male zone 10–20 × ca. 8 mm; male flowers basically white; appendix sessile, 13–16 cm, slender, exserted from throat of spathe and pendulous, proximally white, distally dark red-purple, throughout with numerous filiform neuter flowers 3–5 cm.

李恒南星 li heng nan xing

Plants to 50 cm tall, monoecious or male. Rhizome creeping horizontally, purplish to brownish outside, red-purple inside, subcylindric, to 13 × ca. 4 cm, branching. Cataphylls to 20 cm, some encircling peduncle directly. Leaf 1, expanding simultaneously with inflorescence; pedicel purplish brown, mottled with green, to 30 cm, lacking pseudostem; leaf blade 3-foliolate; petiolules 3.5–4.5 cm; leaflets subequal in size, to 25 × 15 cm; central leaflet oblone-elliptic, base rounded-cuneate, apex acuminate and caudate; lateral leaflets oblique. Peduncle 11–20 cm. Spathe tube white or pale green, narrowly funnel-form, 4.5–6 × 7–9 cm when opened; limb proximal half white, distal half dark red-purple, narrowly deltoid to narrowly deltoid-ovate, 15–20 × 5–6.5 cm, apex acuminate. Spadix bisexual after sex change; female zone 20–30 × ca. 10 mm; female flowers green, bottle-shaped; male zone 10–20 × ca. 8 mm; male flowers basically white; appendix sessile, 13–16 cm, slender, exserted from throat of spathe and pendulous, proximally white, distally dark red-purple, throughout with numerous filiform neuter flowers 3–5 cm.

马尾南星 ma wei nan xing

Arisaema hippocaudatum S. C. Chen & H. Li.

Rhizome oblique or horizontal, light brown outside, violaceous in section, oblique or horizontal, cylindric, 5–6 × 2.5–3 cm, with numerous nodes bearing buds, roots 10–15 cm. Pseudostem absent. Cataphylls 5, flesh-colored, 5–8 × 1.5–2 cm, membranous, 2 encircling petiole and peduncle, 3 enclosing peduncle directly. Leaves 1 or 2, arising at different seasons from different rhizome nodes; petiole viridescant with inconspicuous white spots, cylindric, ca. 45 cm × 5–8 mm; leaf blade green, 3-foliolate; central leaflet with petiolule ca. 1.7 cm, blade elliptic, ca. 21 × 11 cm, base cuneate, apex acuminate with acumen ca. 1 cm; lateral leaflets with petiolule ca. 1.5 cm, blade obliquely broadly lanceolate, ca. 20 × 8 cm, base broadly cuneate, apex acuminate with acumen 0.9–1 cm; lateral veins 7–9 on each side, collective vein 4–9 mm from margin. Peduncle green, cylindric, shorter than pedicles, ca. 20 × 0.5 cm. Spathe green, with numerous longitudinal veins; tube funnel-shaped, ca. 7 × 1.5–3 cm, throat margin recurved to 8 mm wide; limb bent forward, oblong, ca. 6.5 × 4 cm. Bisexual spadix ca. 3.5 cm; female zone ca. 1.5 cm; female flowers densely arranged; ovary greenish, obvoid, ca. 2.5 × 1–2 cm; ovules 4, erect; male zone ca. 2 cm; synandria sparse; synandria of 2 or 3 fused stamens; stalk ca. 2 mm; anthers 3, each comprising 2 thecae; thecae subglobose, ca. 1 mm in diam., dehiscing by an apical slit; appendix sessile, erect, proximally purple, distally green, ca. 5.5 cm × 1–4 mm, usually exserted from spathe tube by ca. 1 cm, wholly covered by filiform neuter flowers; neuter flowers erect, green, 5–10 mm. Male spadix ca. 3 × 2 mm; appendix ca. 5 cm. Fl. Dec–Feb.

Tropical seasonal forests; 1000–1100 m. S Yunnan (Mênga).
except for white center, ca. 12 cm, with proximal margins incurved or ± overlapping to form a cylindric tube to 6 × 2.7 cm, scarcely or slightly auriculate at throat; limb subovate-lanceolate, ca. 8 × 4 cm, apex aristate and recurved. Male spadix sub sessile, ca. 16 cm; fertile zone green, subterete, gradually attenuate distally, ca. 4 cm, loosely flowered; male flowers stipitate, usually diandrous; stipe 0.2–0.9 mm; thecae ellipsoid, 0.4–0.7 mm; appendix extending beyond throat of spathe tube, recurved, greenish, horsetail-shaped, ca. 12 cm, with many filiform subulate neuter flowers; proximal neuter flowers scattered, 3–4 mm; distal ones numerous and crowded, 2.5–5.5 cm. Female spadix unknown. Fl. Jun.

Limestone crevices on hilltops; 600–700 m. Guangxi (Du’an) [Vietnam].

One of us (Murata) recognizes Arisaema hippocaudatum S. C. Chen & H. Li (Acta Bot. Yunnan. 24: 607. 2002) as a rare Chinese species known only from the type and A. victoriae as endemic to Vietnam. In A. victoriae, the main axis of the spadix appendix is distinct and much longer than the branches (neuter flowers) as in A. lihengianum, whereas in A. hippocaudatum, the main axis is not clear and (if still present) is of a similar size and shape to the branches in its distal part. On the other hand, one of us (Li) believes that the two entities are conspecific, based on observations of cultivated plants.

屏边南星 ping bian nan xing

Plants monoecious and male. Rhizome prolonged and thin, 10–15 × 1–2 cm, nodes swollen and globose. Cataphylls 3, pale green with violet spots, encircling peduncle. Leaves 2, arising at different seasons from different rhizome nodes; petiole green, cylindric, to 20 cm × 3–4 mm, base shortly sheathing; leaf blade 3- to 5-foliolate, green, membranous; central leaflet with petiolule ca. 1 cm, blade elliptic, 9–13.5 × 4–5.5 cm, base cuneate; lateral leaflets with petiolule 3–6 mm, blade obliquely ovate-lanceolate, base oblique, apex acuminate with acumen 1.5–2 cm; lateral veins 5–7 on each side, collective vein 1–2 mm from margin. Peduncle encircled by cataphyll, green, cylindric, shorter than petioles, ca. 15 cm. Spathe tube subcylindric, 4–4.5 × ca. 1 cm, throat margins spreading outward; limb green, with a rounded white area ca. 1.5 cm in diam. at proximal part, oblong, 3.5–4 cm, apex abruptly acuminate with a filiform tip. Spadix bisexual after sex change; proximal female zone congested with female flowers; ovary green, obvoid; distal male zone with sparse male flowers; synandria of 2 or 3 fused stamens; anthers brown to creamy white, globose, dehiscing by 2 apical pores; appendix nearly filiform, ca. 3 cm, distal ca. 1 cm covered with numerous filiform neuter flowers, brushlike; neuter flowers slightly recurved, brown or green, filiform, 2–3 mm. Fl. Dec.

- Secondary evergreen forests; 1000–1600 m. SE Yunnan.

7. Arisaema rubrirhizomatum H. Li & J. Murata, sp. nov.

红根南星 hong gen nan xing

Haece species Arisaematii victoriaeae V. D. Nguyen et A. hippocaudato S. C. Chen & H. Li similis, sed ab eis appendice spadici ex ore tubi spatheae non exserta atque floribus neutris brevibus minus quam 7 mm longis differt.

Plants basically dioecious. Rhizome erect, oblique, or horizontal, dark brown outside, purple in section, cylindric or conic, 2–5 × 1–2 cm. Cataphylls 3, encircling pseudostem, lanceolate, membranous, outermost one 1–2 cm, innermost one 18–19 cm. Leaves 1 or 2; petiole purplish green or olive-green with pale green spots, 30–50 cm, proximal 20–30 cm sheathing into pseudostem; leaf blade green, leathery, 3-foliolate; central leaflet with petiolule 1–4 cm, blade elliptic or oblong to lanceolate, 12–26 × 5–12 cm, base cuneate; lateral leaflets sessile or with short petiolule 1–4 cm, blade oblong-lanceolate or obliquely ovate, 10–20 × 3.5–11 cm, apex acuminate. Peduncle colored as petiole, slightly longer than petioles, 30–50 cm. Spathe green with a white area ca. 2 cm in diam. at proximal part of limb; tube 3–5 × 1.5–1.8 cm, throat spreading outward; limb deltoid-ovate, 5–7 × 3.5–5 cm, apex acute. Spadix basically unisexual; female zone ca. 2.2 × 1.5 cm; ovary obconic; ovules 2–4; synandria of 5 stamens, sessile; male zone ca. 3.5 × 5 mm, rarely with a few male flowers above; anthers ovoid, dehiscing by 2 apical slits; appendix dark purplish, 4–5 cm, slender, from base to apex covered with rather numerous filiform or subclavate neuter flowers, brushlike. Berries reddish, ovoid, ca. 5 mm in diam. Seed 1, yellowish, ca. 3.5 mm in diam., rugose. Fl. Feb–May, fr. Jul.

- Evergreen forests, thickets, along streams, in limestone mountain areas; 1000–1900 m. SE Yunnan.

毛笔南星 mao bi nan xing

Arisaema nanjenense T. C. Huang & M. J. Wu; A. quinquefolium Hayata.

Rhzome oblong-or ovoid, 3–5 × 1.5–2.2 cm. Leaves 2 or 3; petiole 18–30 cm, proximal 13–25 cm sheathing into pseudostem, dull purplish green, mottled with dark purple and orange, surrounded by several cataphylls; leaf blade 3- or 5-foliolate; leaflets base rounded to cuneate, margin entire, apex acute to acuminate, often mucronate at tip; central leaflet with petiolule 1–2.5 cm, blade elliptic to lanceolate; lateral leaflets with petiolule 3–10 cm, blade oblong to lanceolate, oblique at base. Spathe greenish on both surfaces with a semilunate white spot in throat; tube cylindric, (3–)4–6 × 1–1.7 cm; limb triangular-ovate, 1.5–2 cm wide, apex acute. Spadix bisexual in mature plants; female zone ca. 2.5 cm × 5 mm; ovary obconic; ovules 4; male zone ca. 1.8 cm × 4–5 mm; synandria lax, of 3 stamens; anthers dehiscing by 2 apical pores; appendix narrowly pyramidal, 6–7 cm, distal part filiform and weakly curved, distal 1.2–2 cm covered with filiform neuter flowers ca. 3 mm. Berries red, conic-ovoid. Seeds 2 or 3, cream-yellow spotted with dark purple. Fl. Mar, fr. Jul.

- Low to middle elevations. S Taiwan.

黎婆花 li po hua
Rhizome cylindric, ca. 5 × 2–3 cm. Leaves 2; petiole dull green, unmarked or mottled with brown-purple, to 50 cm, proximal 10–30 cm sheathing into pseudostem; leaf blade pedate, papery; leaflets pale green abaxially, dull green adaxially; central leaflet with petiolule 1–2 cm, blade elliptic, 14–16 × 6–8 cm, base broadly cuneate, apex abruptly acuminate, sometimes ciliate; lateral leaflets sub sessile or with petiolule 5–10 mm, blade 13–15 × 5–6 cm; outermost ones obliquely elliptic, ca. 10 × 3 cm. Peduncle green, equaling or longer than petioles by 3–5 cm. Spathes tube green, with longitudinal white stripe on back up to base of limb, funneliform, 4–5.2 cm, throat obliquely truncate, outcurved for ca. 2 mm; limb dark purple with purplish spots, or green with purple reticulation, or totally olive-green, ovate, 4–4.7 × ca. 2.7 cm, acuminate and caudate at apex. Spadix bisexual when mature; female zone 2–2.5 cm; male zone 1–1.5 cm; synandria lax; anthers 1–3, stipitate; thecae oblong, dehiscing by lateral slits; appendix sessile, erect or sometimes recurved at apex, narrowly cylindrical or fusiform, 4.5 cm × 1.5–2.5 mm, proximal 3–4 mm covered with many erect filiform neuter flowers 3–4 mm. Infructescence 4–5 cm. Berries reddish, ovoid, ca. 6 × 4 mm. Fl. Jun, mature fr. Nov.

三匹箭 san pi jian

Arisaema inkiangense H. Li; A. inkiangense var. maculatum H. Li.

Plants monocious and male, evergreen. Rhizome pale yellow outside, purple or violet in section, cylindric. Cataphylls withering, yellowish red to creamy red, narrowly lanceolate, membranous. Leaf 1; petiole encircled by cataphylls, pale, unspotted, to 40 cm, base sheathing for ca. 1.5 cm; leaf blade pale green abaxially, green adaxially, papery, 3-foliolate; central leaflet with petiolule ca. 2 cm, blade elliptic, 9–25 × 5.8–10 cm, base obtuse or shortly cuneate, apex acuminate; lateral leaflets with petiolule 5–10 mm, blade elliptic-lanceolate, 8–20 × 3.5–9.5 cm, base obliquely rounded. Peduncle encircled by 2 cataphylls, separated from petiole, terete, 25–35 × 1.2–1.5 cm. Spathes tube greenish white, with ca. 1 cm white base, ca. 5 cm × 8 mm, throat margin narrowly auriculate, outwardly recurved, auricle ca. 8 mm wide; limb arching, green with a large rounded white area at base, obvate-lanceolate, ca. 6 × 3 cm, membranous, with a tail ca. 5 mm. Spadix bisexual in mature plants, unisexual (male) in small plants. Bisexual spadix: basal female zone cylindric, ca. 1.5 cm, ca. 5 mm in diam. at base, densely flowered; ovary oblong; ovules 2–4, basal, erect; style short but distinct; stigma capitulate, pilosulous; central male zone ca. 1.5 cm with sparse male flowers; synandria of 2 or 3 stamens; anthers sessile, or filaments ca. 1 mm; thecae subglobose, opening by an apical slit; appendix erect, sessile, green, narrowly cylindric, without neuter flowers, distally slightly rugose. Unisexual spadix: male zone ca. 2 cm, ca. 3.5 mm in diam. with a stipe ca. 2 mm; appendix as in bisexual spadix, with or without 2 or 3 subulate neuter flowers in proximal part. Fl. Oct–Nov.

Dense forests, in mountain valleys; 400–1700 m. Yunnan [NE India, N Myanmar].

版纳南星 ban na nan xing

Plants evergreen. Rhizome yellowish outside, purplish inside, robust, 8–9 × 3–4 cm, rooting on whole surface and in different directions. Leaves 3–5 together, separately arranged on rhizome back, perhaps from different seasons; petiole pale green with dark green striae and whitish spots, or pinkish brown with black or dark brown short striae and sparse spots, cylindric, 28–60 × 0.4–2 cm, encircled by cataphylls; leaf blade pale green abaxially, green adaxially, subpapery, 3-foliolate; leaflets entire, base obtuse, apex acuminate with acumen 1–2 cm; central leaflet with petiolule 2.8–4.6 cm, blade green with scattered pale brown and black spots, elliptic to oblong, 14–24 × 6–10 cm, base cuneate to rounded; lateral leaflets with petiolule 5–10 mm, blade lanceolate, oblique, 12–24 × 4.5–10 cm, base obliquely rounded; cataphylls 2 or 3, colored as petiole, 5–20 cm. Peduncle encircled in cataphylls, colored as petiole, to 70 cm. Spathes green; tube 6–8 × 1.5–2 cm, throat margins spreading, auriculate; limb arching, obovate, ca. 5 × 3.5–4 cm, apex acuminate or acute. Spadix bisexual and unisexual (male). Bisexual spadix: female zone ca. 2 cm × 7 mm; ovary pale green, ovoid; style short; stigma pale white, disciform; male zone ca. 1.5 cm × 3 mm, sparsely covered by male flowers; appendix erect, greenish white, cylindric, ca. 3 cm × 1.5–3 mm, apex subclavate, verrucose to echinate. Male spadix: male zone ca. 6.7 cm, base ca. 6 mm in diam.; male flowers dense, of 2–4 stamens, sub sessile; anthers violet to cream-yellow, ovoid or subglobose, dehiscing by an apical united slit; appendix cylindrical, ca. 4.2 cm × 3 mm, base usually with some male flowers, apex subclavate, rugose, ca. 4 mm in diam. Berry orange-red, obovoid, ca. 5 × 4 mm. Fl. Feb–Mar, fr. Oct.

Primarily tropical rain forests; 700–1000 m. S Yunnan.

Arisaema bannaense is quite similar to A. garrettii Gagnepain, from Thailand. The species are possibly distinct only in the shape of the apical part of the spadix appendix. According to observations by Murata in S Yunnan, the appendix of A. bannaense is always subclavate, acuminate, and verrucate to mucilate, and the apex is exserted from the spathe tube so that it is clearly seen from outside. In specimens examined by Murata, the appendix of A. garrettii is columnar, with a rounded apex, and equaling the spathe tube in length so that the apex is hardly seen from outside. The two taxa may be allopatric varieties.

线花组 xian hua zu

Tuber subglobose. Leaf blade 3-foliolate. Spadix appendix sessile, attenuate distally, with neuter flowers at least in female inflorescence, or if lacking then spadix bisexual.

文山南星 wen shan nan xing

Plants to 30(–40) cm tall, but usually smaller. Tuber globose, 1–2 cm in diam., with distinct axillary buds. Cataphylls 2 or 3, surrounding pseudostem, purplish green, without distinct marks. Leaf usually 1, expanding earlier than inflorescences; petiole 20–40 cm, proximal (3–)5–12(–15) cm sheathing into pseudostem; leaf blade 3-foliolate; leaflets sub-sessile; thecae subglobose, opening by an apical slit; appendix filiform, 2–4 cm, at apical 1–1.5 cm narrowed at base, not exerted from spathe, 3–4.5 cm. Infructescence pendulous. 2n = 24*.

● Limestone crevices; ca. 1300 m. SE Yunnan (Wenshan).

画笔南星 hua bi nan xing

_Arisaema matsudae_ Hayata.

Tuber globose, 1–2(–3) cm in diam. Cataphylls lanceolate, ca. 8 cm. Leaves 2; petiole 25–30 cm, below middle sheathing into pseudostem; leaf blade 3-foliolate; central leaflet petiolar, elliptic, ca. 14 × 6 cm; lateral ones subglobose, shorter than terminal, oblong-lanceolate, ca. 10 × 4 cm, base oblique, apex acuminate; collective vein 0.3–2 mm from margin. Peduncle as long as or longer than petals. Spathe pale green, cylindrical, 3–4 × 6–12 cm, throat margins spreading but not recurved; limb transversely demarcated between proximal white part and distal green part. Spadix unisexual. Male spadix erect, dark green, ovate-lanceolate, ca. 3 × 1.5 cm, apex acuminate; lateral leaflets with petiolule 3–5 mm, blade ovate-oblong, 8–10 × 2.8–6 cm, apex acute to obtuse, base attenuate, ovary conic, ovules 5, apex constricted into a short style; stigma capitate; appendix green, narrowly cylindrical, 4–5 cm × 2–3 mm, base ca. 2 cm and apex 8–10 mm, covered with broadly filiform neuter flowers (1.5–2 mm). Male spadix; male zone narrowly conic, 3–4 cm, with sparse male flowers; synandria of 3 stamens; anthers ovoid, opening by longitudinal apical slits; appendix filiform, 3–4 cm, at apical 1–1.5 cm covered with filiform or subulate neuter flowers (1–2 mm). Fl. Apr–Jun.

● Understories of dense forests; below 1000 m. Guangdong, Guangxi, Hainan, Taiwan.

滇南南星 dian nan nan xing

Tuber globose, 1–2 cm in diam. Cataphylls green, acute. Leaf 1; petiole green, proximally sheathing into pseudostem; leaf blade 3-foliolate; leaflets glaucous abaxially, green adaxially; central leaflet with petiolule ca. 15 mm, blade ovate or ovate-oblong, 8–10 × 2.8–6 cm, base obtuse, apex acuminate; lateral leaflets with petiolule 3–5 mm, blade oblong-lanceolate, 9–10 × 4.8–5 cm, base rounded, oblique, apex acuminate. Peduncle as long as petals, slender. Spathe small, ca. 6.5 cm in total; tube pale green, funnel-form, ca. 2.8 cm, throat ca. 1.5 cm in diam., margins obliquely truncate, not auriculate; limb erect, dark green, ovate-lanceolate, ca. 3 × 1.5 cm, apex acuminate with a short tail at tip, base slightly constricted, with a white ca. 5 mm high basal zone. Spadix unisexual. Male spadix slender; male flowers sparse; synandria of 2–4 stamens, subglobose; thecae subglobose, opening by an apical slit; appendix erect, ca. 2.2 cm, slender, with several scattered, short, subulate neuter flowers from base to apex; neuter flowers less than 1 mm. Female spadix unknown. Fl. May.

Tropical forests; ca. 800 m. S Yunnan (Jinghong, Simao) [Vietnam].

Chinese records of _Arisaema balansae_ Engel (H. Li, Bull. Bot. Res., Harbin 6(3): 99. 1988) and _A. ramulosum_ Alderwerelt van Rosenburgh (Gusman & Gusman, Gen. _Arisaema_, 220. 2006; Gusman, Aroideana 30: 43. 2007, p.p., as to Vietnamese element; Yin & Gusman, Aroideana 31: 98–100. 2008) are referable to _A. austro-yunnanense_. In the treatment of _Arisaema_ in Flora Malesiana (Murata, in press), _A. balansae_ will be recognized in a broad sense including _A. ramulosum_ and _A. austro-yunnanense_. Gusman et al. (loc. cit.) separated _A. ramulosum_ from _A. balansae_; they did not refer to _A. austro-yunnanense_, but it may have been included in their concept of _A. ramulosum_. In the present treatment, however, it seems best to recognize _A. austro-yunnanense_ as a separate species because it has been known by a single specimen (the type) and we cannot consider variation in China. Gusman et al. (loc. cit.) also reported _A. barbatum_ Buchet (Notul. Syst. (Paris) 1: 366. 1911) from S Yunnan (Xishuang-

Arisaema jinshaijiansense H. Li.

Plants deciduous, to 120 cm tall and 60 cm wide. Tuber subglobose or cylindric, 2.5–6 cm in diam. Cataphylls 3, flesh-colored, longitudinally striped and mottled, lanceolate, 2–40 cm, apex obtuse for shortest. Leaves 2, subopposite; petiole light green, plain or stained with purple, to 60 cm, proximal part to 45 cm sheathing into pseudostem; leaf blade 3-foliolate; leaflets abaxially paler, sometimes flushed carmine, adaxially to 45 cm sheathing into pseudostem; leaf blade glaucous abaxially, green and with impressed, thin, and light green veins and a broad, white-green central midvein, margins entire, base convex green, 5–12 cm, membranous, apex acuminate. Leaves 1 or 2; petiole light green, unspotted, 20–30 cm, basal 10–12 cm sheathing into pseudostem; leaf blade subrhombic or cylindric, 20–55 × 10–25 cm, apex acuminate with filiform tail 5–8 mm. Inflorescences unisexual, emerging when leaves unfold and held nearly at foliage level; peduncle pale green, shorter than petioles, 10–20 × ca. 1 cm. Spathe tube green with white stripes, basally white, cylindric, ca. 7 × 1.5 cm, throat not expanded; limb curved forward, green with conspicuous white stripes and a white spot at throat level, oblance-lanceolate, ca. 6 × 2.5 cm, apex long acuminate. Spadix: ovaries congested, ovoid, ca. 2.5 × 2 mm; ovules ca. 2; stigma pendunculate, borne on a short style; anthers 4–6, subglobose, dehiscing by an apical slit; appendix sessile, disciform; ovules 5 or 6, basal, erect; appendix as in female spadix, erect, 2.2–3 cm, without neuter flowers. Inflorescence curved forward or pendulous. Fl. May.

Arisaema menghaiense J. T. Yin, H. Li & Z. F. Xu.

Epiphytes, dioecious. Tuber depressed globose, ca. 5 × 10 cm, renewed seasonally, purple outside with brown spots 1–1.5 mm in diam.; roots whitish, 2–7 cm × 1–2 mm. Leaf solitary, coetaneous with fruit; petiole green, without spots, cylindric, 20–30 × ca. 1 cm, smooth; leaf blade greenish, membranous, 3-foliolate; leaflets petiolulate; central leaflet with petiolule ca. 15 mm, blade ovate, ca. 20 × 10 cm, base cuneate, apex acute; lateral veins numerous; collective vein 2–3 mm from margin; lateral leaflets with petiolule 8–11 mm, blade obliquely ovate-lanceolate, ca. 21 × 8 cm, base obliquely cuneate, apex acuminate with filiform tail 5–8 mm. Inflorescences unisexual, appearing before leaf; peduncle white, terete, ca. 26 × 0.3 cm (male), ca. 25 × 1 cm (female), surrounded by cataphylls; cataphylls 3, pale green, oblong, 18–23 cm, membranous, apex obtuse. Spathe tube green, cylindric, ca. 6 × 1.5 cm, throat margin broadly auriculate, strongly outwardly recurved; limb arched, greenish purple, ovate-lanceolate, ca. 6 × 5 cm, apex acuminate with a purple tail to 60 cm. Female spadix densely flowered; ovaries green, 1-loculed, ovoid; stigmas subsessile, disciform; ovules 5 or 6, basal, erect; appendix as in male spadix. Male spadix with basal fertile part cylindric, ca. 3.8 × 0.5–0.6 cm, densely flowered; synandria subsessile, purple; anthers 4–6, subglobose, dehiscing by an apical slit; appendix sessile, greenish, cylindric, ca. 3.8 × 0.3 cm, apex obtuse, with a few subulate neuter flowers in basal part. Inflorescence cylindrical, ca. 5.2 × 1–1.5 cm. Fl. Apr, fr. May.

About 1800 m. S Yunnan (Menghai) [N Myanmar].

Underground stems tuberous, whitish inside, axillary buds with accessory buds. Phyllotaxy quincuncial, normal leaves pedate. Spadix appendix sessile, with neuter flowers in proximal part.

云台南星 yun tai nan xing

Arisaema dubois-reymondiae Engler; A. zanlaniscianense Pampanini.

Tuber subglobose, ca. 2 cm in diam. Cataphylls 3, greenish brown, membranous, apex obtuse. Leaves 2; petiole green, 24–35 cm, basal 10–18 cm sheathing and forming pseudostem, free part 13–30 cm; leaf blade pedate; leaflets 7–9, sessile to sub-sessile, oblanceolate or oblong to elliptic, base cuneate, margin entire, apex acuminate; rachis between central and lateral leaflets 1–2.5 cm, rachis between outer leaflets 5–10 mm; central leaflet sub-sessile, 7–20 × 2.5–5 cm; outermost leaflets 5–12 × 1.5–2.5 cm. Peduncle shorter than petioles, 13–17 cm, exerted from pseudostem 3–5 cm. Spathes greenish white with 3–5 white stripes inside or (in female) dark purple with pinkish white stripes, ca. 15 cm in total; tube funnelform, 5.5–6 × 2–2.5 cm at throat; limb oblong or oblong-ovate, 7–8 × 3–3.5 cm, acute at apex with an acumen 5–10 mm. Spadix unisexual; male zone ca. 2 cm; synandria lax; anthers 2–4, thecae globose, dehiscing by apical pores; female zone ca. 2 × 1 cm; ovary green; style short; stigma punctate. Appendix sessile, erect, greenish or purplish, cylindric, 4–7–(14) cm × 2–5 mm, proximal part covered with a few acute neuter flowers. Fl. Apr–May.

- Bamboo forests, evergreen forests, thickets; below 1800 m. Anhui, Fujian, Guangdong, Guizhou, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Shanxi, Zhejiang.

宜兰南星 yi lan nan xing

Tuber depressed globose, 1.3–3 cm in diam. Cataphylls 3–5, whitish to greenish, fleshy, apex mucronate. Leaves 2; petiole terete, 20–55 cm, basal 10–30 cm sheathing and forming pseudostem; leaf blade pedate; leaflets 7–15, sessile, oblanceolate to elliptic, base cuneate, apex acuminate; central one 10–22 × 2–4.5 cm, longer than or equal to adjacent one. Peduncle 11.5–37 cm, free part 1.5–7 cm, usually much shorter than free part of petiole. Spathes pale greenish yellow outside, dark purple inside, gradually becoming pale to reddish brown proximally, cylindric, slightly auriculate at throat, 6–9 × 1.3–2 cm; limb pale greenish yellow outside, dark purple inside, ovate, 6–10 × 3–5 cm, apex acute or sometimes acuminate. Spadix unisexual, 1.5–2.4 cm in male, 1.5–3.4 cm in female. Appendix distinctly exerted from spathe tube, proximally reddish, distally dark purple to black, clavate, 9–15 cm, proximally gradually narrowed to fleshy base or sometimes stipitate at base with some echinate neuter flowers, distally bent outward or slightly downward. Fl. Feb–Mar.

- Broad-leaved forests; 1600–1900 m. N Taiwan.

湘南星 xiang nan xing

Tuber depressed globose, ca. 2 cm in diam. Cataphylls to 15 cm. Leaves 2; petiole 45–55 cm, proximal half sheathing and forming pseudostem; leaf blade pedate; leaflets 7–9, oblanceolate; central leaflet shortly petiolate, larger than lateral ones; rachis between central and lateral leaflets 4–6 mm. Peduncle shorter than petioles, free part 3–6 cm. Spathes reddish inside; tube cylindric, ca. 7 × 2 cm, throat slightly recurved, not auriculate; limb ovate-lanceolate, ca. 6 cm, apex long acuminate. Spadix unisexual; male ca. 1.5 cm; female ca. 2.5 cm; ovary elliptic, ca. 3 mm; style short; stigma small, pilose. Appendix sessile, suberect or slightly recurved, narrowly pyramidal, 4–7 × ca. 4.5 mm, narrowed toward base and apex, basal ca. 1.5 cm in female spadix usually with acute neuter flowers 4–5 mm, smooth in male spadix. Fl. Mar–May.

- Forests, streamsides; 200–800 m. Chongqing, Guangdong, Hubei, Hunan, E Sichuan.

棒头南星 bang tou nan xing

Tuber subglobose or ovoid-globose, 2–4 cm in diam. Cataphylls green, to 20 cm, membranous, apex obtuse or acute. Leaves 2; petiole green, 40–60 cm, proximal half sheathing; leaf blade pedate; leaflets (7–)11–15, sessile, oblone or oblanceolate, papery, base cuneate, margin entire, apex abruptly acuminate and caudate; central 5 leaflets nearly equal, 10–19 × 3–6 cm, outward gradually smaller, outermost one 2–4 × 0.5–1.5 cm; rachis between leaflets 5–15 mm. Spathes green, sometimes purplish, with white stripes or not, 7.5–16 cm in total; tube cylindric or narrowly funnelform, 3.5–8 × 1.3–2.5 cm, throat obliquely truncate or rounded, not recurved; limb oblong, 5–8 × 3–3.5 cm, apex acute. Spadix unisexual; male cylindric, 1.2–1.7 cm × ca. 3 mm; synandria purple; anthers 2 or 3; thecae globose, dehiscing by apical pores; female conic or elliptic, 2–2.5 cm × 7–8 mm; ovary greenish, obovoid; ovules 3 or 4; stigma subglobose, ca. 1 mm. Appendix sessile, green to purple, narrowly cylindric, 2.6–7 cm, slender, ca. 1.5 mm in diam., basal 2–3 cm sparsely covered with acute and hooked neuter flowers (1–3 mm), apex abruptly swollen into a clavate head 3–10 × 2–4 mm, densely clavate-echinate. Fl. Apr–Jun.

- Bamboo thickets, broad-leaved forests; 600–1400 m. Chongqing, N Guizhou, W Hubei, Sichuan.

Six species: C China to Japan; four species (all endemic) in China.

1a. Appendix narrowly fusiform, attenuate distally, slightly bent outward .................................................. 20. A. hunanense

1b. Appendix cylindric, erect, apex rounded, capitate or creased.

2a. Appendix slender, erect, apex abruptly capitulate and echinate, slightly exerted from spathe tube .................. 21. A. clavatum

2b. Appendix stout, not capitulate, long exerted from spathe tube.

3a. Appendix smooth ................................................................. 18. A. silvestrii

3b. Appendix twisted and creased in distal section ................................................................. 19. A. ilanense

Six species: C China to Japan; four species (all endemic) in China.
4. Arisaema sect. Arisaema

天南星组 tian nan xing zu

Plants with tuber or rarely with robust rhizome. Leaf usually solitary; leaf blade 3-foliolate, or rarely quinate. Spathe tube sometimes lamellate inside; limb curved forward, usually widened into wings, sometimes galeate. Spadix appendix proximally swollen into a disk and stipitate, distally usually filiform and long exerted from spathe, or subcylindric and not exerted from spathe. Thecae united at apex, dehiscing by a single horseshoe-shaped slit.

About 17 species: mostly in Himalayan region and SW China; 16 species (seven endemic) in China.

1a. Lateral veins of leaflets numerous, parallel
1b. Lateral veins not parallel.

2a. Central leaflet obovate, obcordate, or obdeltate, shorter than wide.
2b. Central leaflet elliptic, ovate, or rhombic, longer than wide and as long as lateral lobes.

3a. Spadix appendix filiform
3b. Spadix appendix subcylindric, apex rounded.

4a. Spadix appendix filiform
4b. Spadix appendix subcylindric, apex rounded.

5a. Pseudostem, petiole, and peduncle verrucose or finely asperate
5b. Pseudostem, petiole, and peduncle smooth

6a. Inflorescence ca. as high as leaf blade
6b. Inflorescence distinctly below leaf blade.

7a. Spadix appendix basally densely rugose
7b. Spadix appendix smooth throughout.

8a. Spathe smaller, tube 1.5–3.5 cm
8b. Spathe larger, tube 3–5 cm

9a. Underground stems rhizomatous or spathe throat galeate-auriculate; all leaflets petiolulate.
9b. Underground stems tuberous; spathe throat not galeate-auriculate; leaflets basically sessile.

凌云南星 ling yun nan xing

Plants dioecious. Tuber subglobose, 3–7 cm in diam., with many small tubercles. Leaf solitary, emerging after anthesis; petiole ca. 30 cm, basal part forming pseudostem; leaf blade 3-foliolate; leaflets with petiolules 1–1.5 cm; central leaflet rhombic, ca. 24 × 14 cm; lateral leaflets oblique, outer side often ca. 2 × as wide as inner side, ca. 20 × 13 cm, base cuneate at inner side, rounded at outer side. Peduncle shorter than petioles, ca. 25 cm × 5 mm. Spathe purple with white lines; tube funnel-form, ca. 8 × 2.5 cm, without lamella inside; limb incurved, galeate, lateral margins elongated into broad wings, with whitish reticulate networks on both sides, ca. 20 × 20 cm, base constricted, apex rounded with an acumen 3–4 cm. Spadix unisexual; female zone conic, ca. 3 × 2 cm; ovary cylindrical, ca. 5 mm; ovules 2, basal, erect, fusiform; style short; stigma disciform; male zone cylindrical, ca. 3 cm × 9 mm; synandria of 2 or 3 stamens; anthers stipitate, dehiscing by horseshoe-shaped slit; appendix purple, flagellate, ca. 44 cm (female) to 143 cm (male) in total, proximal 13–14 cm subcylindric, ca. 1.5 cm in diam., base attenuate, not truncate, stipe ca. 1.8 cm × 8 mm (female), ca. 4 × 3 mm (male), distal filiform part ca. 30 cm (female) to 130 cm, pendulous. Berries red. Fl. Apr–Jun, fr. Jul.

Swamps by mountain streams; 1400–3000 m. Guangxi [W Myanmar].

Arisaema daohaiense H. Li.

Plants dioecious. Rhizome horizontal, outside pale brown, inside yellowish, cylindrical, 7–8 × 5.5–8 cm, bearing some offsets around. Cataphylls 2 or 3, deciduous, transparent, pink, 30–60 cm, membranous. Leaf 1; petiole violet, greenish distally, smooth and not spotted, ca. 80 cm, ca. 3 cm in diam. in prox-
mal pseudostem part; leaf blade 3-foliolate; leaflets with petio-
lules 2–3.5 cm, blade greenish abaxially, green adaxially, pa-
pery, usually covered with hairs; central leaflet narrowly ovate,
to 25 × 18 cm, base rounded, apex acuminate with a long tail;
lateral leaflets obliquely ovate, to 18 × 17 cm in outline, base
outside ca. 2 × as wide as inside, auriculate. Peduncle erect,
pinkish green, not spotted, to 25 cm. Spathe dark purple with
whitish longitudinal lines; tube cylindrical, 8–9 × 2–3 cm, throat
margins slightly recurved, smooth on both sides; limb galeate,
oblung, 8–10 cm, apex acuminate, tip with an acumen 2.5–5
cm; lateral sides widened, membranous, as wings, with whitish
reticulate networks, whitish longitudinal lines from tube con-
nected at middle of limb. Spadix unisexual; female zone sub-
reticulate networks, whitish long itudinal lines from tube con-
connected into flagellum, in total 24–30 cm, pendulous, base trun-
ca; female zone sub-
caudate into a tail 2–20 cm. Spadix unisexual; female zone ca.
1.5 cm; ovary obovoid; style short; stigma small; male zone ca.
2 cm; synandria of 4 stamens, yellow, dehiscing by horseshoe-
shaped slit. Appendic dark purple, narrowly flagellate, 15–60
in total, proximally swollen fusiform or cylindrical, smooth,
distally curving and exserted from tube, gradually drawn into

Evergreen forest margins; 1400–2600 m. NE and NW Yunnan
(Dulong Jiang, Huize) [N Myanmar].

Plants dioecious. Tuber depressed globose, 3–4 cm in
diam. Cataphylls 2 or 3, whitish with purple spots, to 21 cm,
membranous, apex acute. Leaf solitary; petiole pale green, with
purple spots, terete, 30–50 cm, basal part forming pseudostem;
leaf blade 3-foliolate; leaflets subsessile, abaxially grayish
green and densely covered with matted hairs and sparse golden
scales, adaxially green and with dense papillae; central leaflet
elliptic, 15–35 × 8–19 cm, base cuneate, apex acute; lateral
leaflets obliquely ovate-oblong, outer base ca. 2 × as wide as
inner side, rounded. Peduncle terete, 18–32 cm. Spathe purple
with whitish longitudinal lines; tube cylindrical, 6–7 × 1.5–2 cm,
throat margins slightly recurved; limb obovate-spatulate, 7–8 ×
4–5 cm, apex abruptly acuminate with a tail 2–3 cm, strongly
downcurved. Spadix unisexual; female zone ca. 2.5 cm; ovary
pale green, subcylindric; stigma sessile, concave; appendix sub-
sessile, purple, proximally narrowly conic, distally tapering and
drawn into flagellum, in total 24–30 cm, pendulous, base trunc-
ate; male zone ca. 2 cm; synandria of 2 or 3 stamens, con-
nected filaments distinct; anther purple, fused from 2 thecae,
dehiscing by horseshoe-shaped slit. Fl. May.

- Mixed forests; ca. 2700 m. W Yunnan (Lushui).

25. Arisaema intermedium Blume, Rumphia 1: 102. 1835.高原南星 gao yuan nan xing

Plants dioecious. Tuber depressed globose, 2–4 cm in
diam. Cataphylls 2 or 3, green to purple, 16–20 cm. Leaves 1 or
2; petiole green, 15–50 × 1–1.5 cm, basal part forming pseudostem;
leaf blade 3-foliolate; leaflets sessile or shortly petio-
lulate; central leaflet ovate, rhombic, or elliptic, (7–)9–12 × 3–
11 cm, base cuneate, apex acute to acuminate; lateral leaflets
obliquely ovate or rhombic, as large as central leaflet. Peduncle
green and unmarked, shorter than petioles, 10–26 cm. Spathe
green, rarely dark purple, with green or white lines; tube
broadly cylindric, (3–)3.4 × 1.5–2.5 cm, smooth inside, throat
margins obliquely truncate, not auriculate; limb dark purple,
yellowish green, or green, 7–16 × 2–6.5 cm, apex acuminate-
caudate into a tail 2–20 cm. Spadix unisexual; female zone ca.
1.5 cm; ovary obovoid; style short; stigma small; male zone ca.
2 cm; synandria of 4 stamens, yellow, dehiscing by horseshoe-
shaped slit. Appendix dark purple, narrowly flagellate, 15–60
cm in total, proximally swollen fusiform or cylindrical, smooth,
distally curving and exserted from tube, gradually drawn into

Mountain slopes, grassy places; 2600–3400 m. S Xizang, Yunnan

26. Arisaema costatum (Wallich) Martius ex Schott & End-
licher, Melet. Bot. 17. 1832.多脉南星 duo mai nan xing

A. costatum Wallich, Tent. Fl. Napol. 28. 1824.

Plants dioecious. Tuber brown outside, white inside, de-
pressed globose, 3–5 cm in diam. Cataphylls 3, ca. 50 × 25 cm,
membranous. Leaf solitary; petiole grey, often slightly pur-
plish, terete, 30–50 cm, proximal 1/4–1/3 sheathing into pseu-
dostem, ca. 1 cm in diam.; leaf blade 3-foliolate; leaflets pale
green abaxially, deep green adaxially, shortly petiolulate or
subsessile; terminal elliptic or oblong, 16–30 × 9–16 cm, base
auriculate and rounded, inner base narrowly cuneate, apex acu-
minate; lateral veins very numerous and running almost parallel,
distinctly raised abaxially, impressed adaxially. Peduncle
emerging from pseudostem, shorter than petioles, 25–45 cm.

Spathe dark purple, with white longitudinal lines; tube cylin-
dric, 4–8 cm, slightly costate inside, but in Xizang specimens
almost smooth inside, throat margins slightly recurved; limb
curved, narrowly ovate-oblong, 3–4 cm, apex acuminate with
a filiform tail. Spadix unisexual; female zone 2.4–3.5 cm; ovary
green; style short; stigma white, disciform; appendix pendulous
from spathe, dark purple, very long filiform, 20–50 cm, inflated
toward base, base truncate, swollen disciform, with a
stipe 3–5 mm, smooth throughout; male zone 2–3.7 cm; synan-
dria of 3–5 stamens; connected filaments distinct; theca de-

Grasslands in forest areas; 2300–2400 m. S Xizang (Dinggyê,

腾冲南星 teng chong nan xing

Plants dioecious. Tuber globose, 1–2 cm in diam. Cataphylls 2, whitish pink, short, 2–4 cm, membranous. Leaf solitary; petiole terete, 14–77 cm, basal part forming pseudostem; leaf blade 3-foliolate or rarely quinate; leaflets sessile, pale green abaxially, green adaxially; central leaflet elliptic or ovate-elliptic, 5–14 × 3–7 cm, base cuneate, apex acuminate; lateral leaflets obliquely ovate to ovate-lanceolate, 6–12 × 3–9 cm, base cuneate at inner side, rounded at outer side. Peduncle shorter than petioles, 7–25 cm, emerging from pseudostem. Spathe tube purple with white longitudinal lines, funnel-shaped, ca. 7 × 1.9 cm, throat oblique, not auriculate, slightly recurved; limb dark purple with indistinct whitish lines, galeate, oblong in outline, 5.6–6 × 3.5–3.5 cm, incurved, apex deeply 3-lobed; middle lobe smaller, lanceolate, ca. 5 × 2 mm; lateral lobes oblong, ca. 1.5 × 1.3 cm, apex rounded. Spadix unisexual; male zone cylindric, 1–1.5 cm; synandria of 2 or 3 stamens; anthers sub-sessile, globose, dehiscing by horseshoe-shaped slit; appendix pendulous, flagelliform, 8–15 cm, basal 2–3 cm narrowly conic, 2.3–5 mm in diam., base truncate and stipitate; stipe slender, 3–4 mm. Female spadix unknown. Fl. Jun–Jul.

Evergreen forests, Rhododendron thickets on mountain summits; 2600–3200 m. W Yunnan (Jingdong,lushi, Tengchong) [N Myanmar].

美丽南星 mei li nan xing

Arum speciosum Wallich, Tent. Fl. Napal. 29. 1824; A. eminens Schott; A. speciosum var. eminens (Schott) Engler.

Plants dioecious. Rhizome cylindric, 4–10 × 2–4 cm. Cataphylls 2 or 3, reddish brown, inner one to 15 cm. Leaf solitary; petiole pale green, not spotted, 15–50 cm, base forming pseudostem, 1–1.5 cm in diam.; leaf blade 3-foliolate; leaflets with petiolules 1–1.5 cm, pale green with narrow red margin, not spotted; central leaflet dull adaxially, ovate or oblong, 11–13 × 4–7 cm, base cuneate, apex acuminate or acute; lateral leaflets obliquely oblong to lanceolate, larger than central leaflet, 13–16 × 4.5–6.5 cm, base strongly oblique (one side cuneate, other deeply cordate), apex abruptly short acuminate. Peduncle whitish with tiny brown dots, much shorter than petioles, 2.5–10 cm. Spathe dark purple, with whitish longitudinal lines; tube cylindric, 4–10 × 1–3 cm, throat margins obliquely truncate, slightly outcurved; limb arching over spadix, oblong-lanceolate, 8–20 × 6–8 cm, margins narrowly recurved, apically gradually acuminate, drooping. Spadix unisexual; female zone conic, ca. 1.7 × 1.2 cm; ovary obovoid; stigma sessile, punctate; male zone cylindric, ca. 2.5 cm × 5 mm; male flowers purple; synandria of 3–5 stamens; connected filaments distinct; thecae dehiscing by a single horseshoe-shaped slit. Appendix pink to dark purple, very narrowly conic, filiform distally, 20–80 cm, base to 8 mm in diam., narrowed into a stipe ca. 1 cm. Fruiting peduncle erect. Berries red, obovoid-oblconic, angulate. Fl. Apr–Jun, fr. Oct.

Broad-leaved forests; 2400–2800 m. S Xizang [Bhutan, NE India, Nepal].

疣序南星 you xu nan xing

Plants dioecious. Tuber depressed globose, 2–4.5 cm in diam., with many fimbriate roots. Cataphylls 1 or 2, whitish green, flushed purplish, 17–36 × 1–1.5 cm, membranous, apex acute, sometimes obtuse. Leaf solitary; petiole dark green, unmarked, 15–57 cm, smooth, base forming pseudostem; leaf blade 3-foliolate; leaflets paler green abaxially, green adaxially, margin crisped or shallowly crenulate, petiolulate; central leaflet with petiolule 1–3 cm, blade obovate to obcordate, ca. 16 × 20 cm, apex depressed or concave with a short micro; lateral leaflets with petiolule winged and 1–2 cm, blade broadly rhombic or obliquely ovate, 19–26 × 15–20 cm, base obliquely rounded or truncate, decurrent to petiolule, apex abruptly acumin ate or acute, sometimes with filiform tail ca. 1.5 cm. Peduncle whitish green to dark green, unmarked, much shorter than petioles, emerging from pseudostem, 15–20 cm, smooth. Spathe green, greenish, or dark purple emerging from pseudostem, greenish, 40–50 × 0.7–1.2 cm, 1–15 mm from margin; lateral leaflets obliquely ovate, 20–30 × cuneate, apex acute; lateral veins 7 per side; collective veins 3, sligh tly recurved; limb incurved, oblong, ca. 8 × 2–5 cm, apex rounded with acumen ca. 0.5 cm. Spadix unisexual; female zone cylindric, ca. 5.5 × 0.7–1.6 cm; ovary pale green with green stripes, oblong-ovoid, ca. 5 × 2 mm; ovules 9, subbasal; style short; stigma white, pilose; male zone cylindric, ca. 3 × 0.8 cm; synandria stipitate; stipe ca. 1 mm; anthers 3–5 (mostly 4), whitish, obvoid, dehiscing by a horseshoe-shaped slit. Appendix flagelliform, ca. 14 cm, distal part greenish, tortuous, smooth, base swollen to 6 mm in diam., truncate and stipitate, stipe ca. 3 mm.

- Mountains, among shrubs on slopes, meadows by rivers; 2800–3000 m. S Sichuan, NW Yunnan.

刺柄南星 ci bing nan xing

*Arisaema cochleatum* Stapf ex H. Li.

Plants dioecious. Tuber depressed globose, ca. 3 cm in diam. Cataphylls 2 or 3, purplish, 15–20 cm. Leaf solitary; petiole 30–50 cm, with dense whitish papillate spines, basal ca. 5 cm sheathing into pseudostem; leaf blade 3-foliolate; central leaflet broadly obovate, 16–23 × 18–27 cm, base cuneate, apex truncate or concave with acute acumen; lateral leaflets rhombic-oblong, 17–28 × 15–22 cm; all leaflets spinose at midrib abaxially. Peduncle 25–60 cm, verrucose, scabrid. Spathe dark purple, with whitish green stripes; tube cylindric, 5–6 cm, throat margins not recurved or auriculate; limb suberect, oblongate or ovate-lanceolate, 8–12 cm, apex acuminate. Spadix unisexual; female zone conic, 2–3 cm; ovary subcylindric; stigma sessile, disciform; male zone cylindric, ca. 3 cm; synandria lax, shortly stipitate; anthers 3, yellowish, depressed globose, dehiscing by horseshoe-shaped slit. Appendix cylindric, 6.5–9 cm, base abruptly thickened, 2.5–4 mm in diam., truncate, with stipe 3–5 mm, apex slightly recurved, not pendulous. Fl. May–June.

- Forests, thickets; 1300–2900 m. Chongqing, S Gansu, W Henan, W Hubei, NE Hunan, Shanxi, E Sichuan.
slightly recurved, not auriculate; limb slightly incurved, dark brown with whitish stripes, oblong, 7.5–8 × 2.4–3 cm, base not constricted, apex acuminate with white reticulate stripes. Spadix unisexual; male zone cylindric, 1.3–1.7 cm; synandria lax, stipitate; filaments 1.5–2 mm; anthers 2–4, dehiscing by horseshoe-shaped slits; appendix distally curved, cylindric, ca. 6 cm in total, proximal 2.5–3 cm suberecet, ca. 3 mm in diam., abruptly swollen toward base, base conic, 4–5 mm in diam., truncate, with stipe ca. 4.5 × 1.3 mm, apex attenuate, obtuse. Female spadix unknown. Fl. Jul.

- Evergreen broad-leaved forests slightly disturbed by roads; 2500–2600 m. NW Yunnan (Gongshan).

This species is named in honor of Dr. Bruce Bartholomew of the California Academy of Sciences, U.S.A., a senior researcher of the biodiversity of the Gaoligong Shan in W Yunnan, where he has collected extensively almost every year since 1998.

川中南星 chuan zhong nan xing

Arisaema wilsonii var. forrestii Engler.

Plants dioecious. Tuber dark brown outside, whitish inside, globose, 5–7 cm in diam., bearing some tubercles around. Cataphylls 3 or 4, dark purple, with tiny greenish stripes, to 30 × 7 cm, apex obtuse. Leaf 1(or 2); petiole to 130 cm, basal part sheathing into short pseudostem; leaf blade 3-foliolate; leaflets sessile, dull abaxially, light green axially, margins usually cristaite or crenulate; midrib and lateral veins raised abaxially; central leaflet depressed obovate, 15–26 × 18–28 cm, base cordate, apex nearly truncate with a broad and short acumen; lateral leaflets rhombic or obliquely ovate, longer than central one, to 37 × 24 cm, apex abruptly acuminate. Peduncle yellowish green, shorter than spathe, 5–6 cm, slender, base suddenly expanded into a disk, stipitate, distally recurved. Female spadix unknown. Fl.

- Broad-leaved forests, forest margins, grassy slopes; 1900–3200 m. Gansu, Sichuan (Emei Shan), SE Xizang, W Yunnan.

The long peduncle, which lifts the inflorescence as high as the leaf blade, is probably an adaptation to its grassy habitat and makes this species comparable to the Himalayan Arisaema propinquum Schott.

猪笼南星组 zhu long nan xing zu

象南星 xiang nan xing

Arisaema dilatatum Buchet; A. rhombiforme Buchet.

Plants dioecious. Tuber subglobose, 2–5 cm in diam. Cataphylls usually 2, reddish brown, to 13 cm, acute. Leaf solitary; petiole green, 20–30 cm, often verrucose, base forming pseudostem, ca. 2 cm in diam.; leaf blade 3-foliolate; leaflets green with cristaite margins; central leaflet sessile, obovate to obcordate, 5–10 × 6–13 cm, base narrowly cuneate, apex abruptly acute; lateral leaflets obliquely oblong or ovate, 7–14 × 5–10 cm, base broadly cuneate, apex acute. Spathe purple with green or whitish stripes; tube cylindric, 3–5 × 2–2.5 cm, throat margins obliquely truncate, neither recurved nor auriculate; limb incurved or suberect, dark purple, oblong, 7–10 × ca. 4 cm, apex abruptly acuminate. Peduncle green, 11–15 cm, often verrucose. Spadix unisexual; female zone cylindric, ca. 2 × 1.2 cm; ovary green, oblong-ovoid; style green, short; stigma white or purple, pilose; male zone cylindric, ca. 3 × 1.1 cm; synandria stipitate; stipe reddish, 2–3 mm; anthers 2–5, yellow, obovoid, dehiscing by a horseshoe-shaped slit. Appendix sigmoid, to 20 cm in total, proximal 4–5 cm whitish or purplish to dark purple, cylindric, ca. 8 mm in diam., abruptly narrowed at base into stipe ca. 8 mm, distally narrowed into flagellum. Berries red, oblong. Seeds 5–8, pale brown, ovoid. Fl. Jun–Jul, fr. Aug.

Coniferous forests, bamboo forests, meadows, usually among mossy rocks; 1800–4000 m. Chongqing, Gansu, Guizhou, Sichuan, Xi- zang, Yunnan [Bhutan, Myanmar].

小南星 xiao nan xing

Plants dioecious. Tuber globose, 1.2–1.8 cm. Cataphylls 3–4.5 cm, acute. Leaf solitary; petiole green, 6–18 cm, smooth, base forming pseudostem; leaf blade 3-foliolate; central leaflet obovate or obcordate, 1.8–5.5 × 2–6 cm, base cuneate usually with red margins, apex truncate or concave, with a short acumen; lateral leaflets obliquely oblong, re- niform, dehiscing by horseshoe-shaped slit. Appendix robust, greenish dark purple, to 23 cm in total, proximally narrowly pyramidal, ca. 1.4 cm in diam., base truncate with a stipe ca. 10 × 7–8 mm, distally gradually narrowed into flagellum, tortuous, sometimes pendulous. Berries red, oblong, ca. 10 × 7 mm when mature. Fl. May, fr. Jun.

- Alpine grasslands, meadows; 3000–3600 m. W Sichuan (Kang ding), SE Xizang, Yunnan (Dali, Luquan, Yangbi).
Underground stems tuberous. Phyllotaxy quincuncial. Leaves 3-foliolate or pedate (to 9-foliolate), usually glaucous abaxially. Inflorescence emergent and unfolded before leaves. Spadix appendix erect, terete, base stipitate.

Three species: SW China to E Himalayas; three species (one endemic) in China.

1a. Leaves 7–9-foliolate; peduncle shorter than petioles ................................................................................................ 40. *Arisaema meleagris*

1b. Leaves 3–5(–7)-foliolate; peduncle longer than petioles.

2a. Leaves 3-foliolate ....................................................................................................................................................... 38. *Arisaema wattii*

2b. Leaves (3–)5(–7)-foliolate ........................................................................................................................................ 39. *Arisaema nepenthoides*

双耳南星 shuang er nan xing

*Arisaema biauriculatum* W. W. Smith ex Handel-Mazzetti; *A. pangii* H. Li.

Plants dioecious. Tuber depressed globose, 2.3–5 cm in diam. Cataphylls 3 or 4, green or violet, with purplish spots, 15–20 cm, apex acute or obtuse. Leaves 2; petiole yellow-green with dark brown spots consisting of tiny striae, finally to 60 cm, proximal 1/3–1/2 forming pseudostem; leaf blade 3-foliolate; leaflets sessile, green; central leaflet elliptic, 15–30 × 4–10 cm, base cuneate, apex acuminate; lateral leaflets narrowly obovate, oblique, as long as central one, base auriculate, rounded on outer side, narrowly cuneate on inner side. Inflorescence emerging before leaves; peduncle as long as petioles. Spathе purplish brown or purplish green, 11–13 cm in total; tube cylindrical, 4.5–6.5 × 1–2 cm, throat margins with horizontal auricle 1.5–2.5 cm wide; limb broadly ovate, 6–7 × 3.5–5 cm, base slightly constricted, apex shortly acuminate. Spadix unisexual; female zone conic, 1.5–2 × ca. 1 cm; ovary obovoid; ovules 4, basal; style short; stigma disciform; male zone ca. 1.5 cm; synandria lax; anthers 1–3, violet, shortly stipitate; thecae globose, dehiscing by apical pores. Appendix erect, whitish green, cylindrical, 6–8 cm × 4.5–5 mm, base truncate with stipe 5–7 mm, middle part slightly constricted, apex obtuse. F1. May–Jun. 2n = 26, 26 + 1B.

**Tsuga** or *Quercus* forests, forest banks and margins; 2700–3600 m. S Xizang, Yunnan [Bhutan, NE India (Darjeeling, Sikkim), N Myanmar, Nepal].

A Chinese record of *Arisaema ochraceum* Schott (Lacaita, J. Linn. Soc., Bot. 43: 483. 1916) is referable to *Arisaema nepenthoides*.

褐斑南星 he ban nan xing

*Arisaema meleagris* var. *sinuatum* Buchet; *A. paichuanense* Z. Y. Zhu; *A. shimiensense* H. Li.

Tuber subglobose or depressed globose, 1–2.5 cm in diam. Cataphylls 2.4–12 cm, membranous, apex obtuse. Leaf solitary, pedate; petiole green with brown spots, 10–23 cm, proximally forming pseudostem; leaflets 7–9(–12), lanceolate, 3 cm (outermost one) to 10 × 1–2.5 cm, base acute, margin entire, usually erose, apex acuminate; central 3 subequal, remote, sessile; rachis between leaflets 5–10 mm. Peduncle green with brown spots, shorter than petioles, 5–15 cm. Spathе purplish brown with numerous dark brown spots, 6–9 cm in total; tube cylindrical, 3–4 cm × 8–12 cm, throat auriculate and outcurved; limb suberect, dark purple at apex, ovate to elliptic, ca. 3.5 × 2 cm, apex acute or acuminate. Spadix unisexual; female zone ca. 7 × 4 mm; ovary yellow-green, obovoid; stigma subsessile, subglobose; male zone ca. 7 mm; synandria lax; anthers 2–4, sessile; theca subglobose, dehiscing by lateral slits. Appendix erect, purple in basal and apical parts, whitish with purple spots at base, subcylindrical, 2.5–3.5 mm, base narrowed into stipe 5–10 mm, apex obtuse. Fl. May–Jun.

- Broad-leaved forests, bamboo thickets; 2000–3000 m. Chongqing (Chengkou), Sichuan, Yunnan (Dali, Zhenxiang).

This species is similar to *Arisaema auriculatum* in *A. sect. Torvosa* in its small size, range of variation of leaf shape, and coloration of the spathe.

象头花组 xiang tou hua zu

Plants dioecious. Tuber depressed globose, 3–5 cm in diam. Cataphylls 3 or 4, pinkish brown, sparsely spotted with whitish dots, 5–24 × 4–5 cm, membranous, apex obtuse, convolute, encircling pseudostem. Leaf solitary; petiole entirely green, 15–35 cm, base forming pseudostem, ca. 1.2 cm in diam., smooth; leaf blade 3-foliolate, papery; leaflets sessile, ovate or nearly orbicular, apex rounded or acute; central leaflet 6–8 × 7–9 cm (at anthesis and much expanded later), base shortly cuneate; lateral leaflets slightly oblique, 5–6 × 4–8 cm. Inflorescence arising before leaves. Spathe pale green or white with green or purple longitudinal lines; tube cylindric, 3–4 × ca. 2 cm, throat margins recurved; limb oval to ovate-lanceolate, 5–6 × 3–4 cm, apex with a tail 2–3 cm. Spadix unisexual; female zone cylindric, 1.2–3.8 cm × 8–20 mm; ovaries dense, greenish purple, ca. 5 mm; ovules 2, basal, erect; stigma convex; male zone narrowly conic. Appendix recurved from middle, sometimes suberect, 1.5–4 cm × 2.5–6 mm, base attenuate into short stipe, 4–8 mm in diam., apex 1–2 mm in diam. Fl. May–Jul, fr. Sep–Oct.

Forests, thickets, grasslands; 900–3000 m. Guangxi, Guizhou, Hunan, Sichuan, Yunnan [N Myanmar].

Plants dioecious. Tuber renewed seasonally, pale brown outside, white inside, depressed globose or globose, 0.5–4 cm in diam., with some offsets above; offsets sessile, globose. Cataphylls 2, green, sometimes purplish, 3–25 cm, papery, apex obtuse. Leaves 1 (or 2); petiole green, without spots, 40–70 cm, basal 2/3 sheathing into pseudostem, encircled by cataphylls; leaf blade green on both surfaces, 3-foliolate; central leaflet with petiolule 0–1.5 cm, blade elliptic, sometimes ovate, 10–19 × 5–12 cm, base cuneate or obtuse, apex acuminate; lateral leaflets sessile or shortly petiolulate, ovate to lanceolate, 9–15 × 5.5–9 cm, base obliquely cuneate. Peduncle emerging from pseudostem, green, without spots, longer (male) or shorter than petioles. Spathe green, with white longitudinal stripes on back; tube 2–2.5 × 1–1.4 cm, throat margin obliquely truncate, not auriculate; limb arching from base, ovate, 5 × 3.5 cm, apex acuminate. Spadix unisexual; female zone conic, 1.5–2 cm, base 3–5 mm in diam.; synandria of 2 stamens; thecae purple, ovoid, opening by an apical pore. Appendix recurved outward or downward, green, narrowly conic, 3.5–6 cm, base 2.5–2.5 mm in diam. Berries red, subcylindric. Seeds 2 or 3, ovoid-globose. Fl. May–Jul, mature fr. Aug–Sep. 2n = 24.

Pinnos and Pinus-Quercus forests, grassy slopes, roadsides, thickets; 700–2100 m. NC and NW Yunnan (Lijiang, Wuding, Yuannou, Zhongdian).

This species is considered to be the diploid ancestor of Arisaema yunnanense, which is tetraploid, with 2n = 48 chromosomes. It also differs from A. yunnanense in having always quinate leaves.

Arisaema prazeri var. variegatum Engler; A. prazeri var. viride Engler. 河谷南星

Plants monoecious and male. Tuber renewed seasonally, subglobose, 1–3 cm in diam. Cataphylls 2 or 3, grayish green, with dark purple striae and spots, 10–28 cm. Leaves 1 or 2; petiole grayish with purple striae and spots, 25–70 cm, proximal 1/2–3/4 sheathing into pseudostem; leaf blade green, membranous, 3-foliolate; leaflets subsessile; central leaflet ovate-lanceolate, 22–25 × 9–10 cm, base cuneate, apex acuminate; lateral leaflets obliquely ovate, 17–18 × 5–10 cm. Peduncle shorter than petioles. Spathe green with white longitudinal stripes on back; tube cylindric, 4–5 × ca. 1 cm, throat margin obliquely truncate, not auriculate; limb erect, lanceolate, 6–10 × 1.5–2.5 cm, apex acuminate, with short tail. Spadix bisexual or male. Male spadix: male zone ca. 3 cm, base 4–5 mm in diam.; synandria of 2 stamens; thecae purple, ovoid, opening by an apical longitudinal slit. Bisexual spadix: female zone proximal, cylindric, 2.3–3 cm × 5–6 mm; ovary green, obovoid; ovules 3; stigma subsessile; male zone distal, 1–3.5 cm × ca. 4 mm; synandria as in male spadix. Appendix pendulous, usually dark purple, filiform, to 80 cm. Fl. Jun.

Tropical thickets, evergreen forests, in limestone areas; 100–1500 m. Yunnan [Myanmar, Thailand].

49. Arisaema auriculatum Buchet, Notul. Syst. (Paris) 2: 123. 1911. 长耳南星

Arisaema auriculatum var. hungyaense (H. Li) Gusman & L. Gusman; A. hungyaense H. Li; A. omeiense P. C. Kao. 长耳南星

Plants dioecious. Tuber globose, small, 1–2 cm in diam., shortly stoloniferous. Cataphylls 3, brownish purple with tiny
black striae, to 18 cm, apex obtuse. Leaf solitary; petiole greenish with some grayish spots, 20–30 cm, proximal 1/3 sheathing into pseudostem; leaf blade petate; leaflets (7–)9–15, sessile, oblanceolate or oblong, base attenuate, margin entire or erose, apex acuminate; central leaflet usually larger than or equaling lateral ones; lateral leaflets 10–12 × 2.5–3.5 cm, outermost ones 1.5–4 × 0.3–1.5 cm. Inflorescence emerging before leaf; peduncle grayish green with whitish spots, shorter than petioles, 12–25 cm. Spathe 7–12 cm in total; tube green or pale brown, densely flushed with dark purple or brown spots, narrowly cylindric, 4–6 cm × 7–15 mm; limb deeply 3-lobed; petiole 60 cm, ascending, sigmoid, dark violet, flagelliform to filiform, 7–12 cm, base sheathing into pseudostem; leaf blade pedate; leaflets (7–)9–15, greenish with some grayish spots, 20–30 cm, proximal 1/3 black striae, to 18 cm, apex obtuse. Leaf solitary; petiole 60 cm, ascending, sigmoid, dark violet, flagelliform to filiform, 7–12 cm, base sheathing into pseudostem; leaf blade pedate; leaflets (7–)9–15, greenish with some grayish spots, 20–30 cm, proximal 1/3 black striae, to 18 cm, apex obtuse. Leaf solitary; petiole 60 cm, ascending, sigmoid, dark violet, flagelliform to filiform, 7–12 cm, base sheathing into pseudostem; leaf blade pedate; leaflets (7–)9–15, greenish with some grayish spots, 20–30 cm, proximal 1/3 black striae, to 18 cm, apex obtuse. Leaf solitary; petiole 60 cm, ascending, sigmoid, dark violet, flagelliform to filiform, 7–12 cm, base sheathing into pseudostem; leaf blade pedate; leaflets 5–17, shortly petiolulate or sessile, pale greenish abaxially, dull green adaxially, variously shaped, oblanceolate, oblong, or linear-oblong, base cuneate, apex acuminate; central leaflet 3–15 × 0.7–5.8 cm, often much shorter than lateral leaflets; first outer leaflets 7.7–24.2(–31) × (0.7–)2–6.5 cm, gradually smaller to outermost leaflets, distance between leaflets 0.5–5 cm. Peduncle usually longer than petioles, 50–80 cm. Spathe tube glaucous outside, whitish green inside, cylindric. 3.2–8 × 1–2.5 cm, throat slightly recurved; limb strongly incurved, pale greenish to pale yellow abaxially, deep green adaxially, ovate, 2.5–8 × 4–9 cm. Spadix bisexual or male. Bisexual spadix: female zone proximal, 1–2.2 cm; ovary globose; style distinct; stigma punctate; ovules 3 or 4; male zone distal, 1.5–3.2 cm; synandria lax; occasionally with echinate neuter flowers. Male spadix: male zone 3–5 cm × 3–5 mm; synandria stalked, consisting of 2 or 3 anthers, each with 2 thecae dehiscing by apical slits. Appendix ascending, sigmoid, pale whitish, gradually tapering from sessile base to very acute apex, ca. 20 cm, 5–11 mm in diam. at base. Berries yellowish red or red, cylindric, ca. 5 mm. Seed usually 1, clavate. Fl. Apr–May, fr. Jul–Sep.

Rocky slopes, path sides, streamssides, especially in disturbed areas; 1300–2000 m. Sichuan, Xizang, Yunnan [Bhutan, India, Nepal].

**Arisaema ambiguum** Engler; *A. brachyspathum* Hayata; *A. kwangtungense* Merrill; *A. limprichtii* K. Krause; *A. manshuricum* Nakai; *A. multisectum* Engler; *A. stenospathum* Handel-Mazzetti; *A. takeoi* Hayata; *A. thunbergii* Blume var. *heterophyllum* (Blume) Engler; *Heterorisaema heterophyllum* (Blume) Nakai; *H. manshuricum* (Nakai) Nakai.

Plants monoecious and male. Tuber depressed globose, 2–6 cm in diam. Cataphylls 4 or 5, membranous. Leaf usually solitary; petiole glaucous, 30–60 cm, proximal 3/4 sheathing into pseudostem; leaf blade petate; leaflets 11–19(–21), shortly petiolulate or sessile, pale greenish abaxially, dull green adaxially, variously shaped, oblanceolate, oblong, or linear-oblong, base cuneate, apex acuminate; central leaflet 3–15 × 0.7–5.8 cm, often much shorter than lateral leaflets; first outer leaflets 7.7–24.2(–31) × (0.7–)2–6.5 cm, gradually smaller to outermost leaflets, distance between leaflets 0.5–5 cm. Peduncle usually longer than petioles, 50–80 cm. Spathe tube glaucous outside, whitish green inside, cylindric. 3.2–8 × 1–2.5 cm, throat slightly recurved; limb strongly incurved, pale greenish to pale yellow abaxially, deep green adaxially, ovate, 2.5–8 × 4–9 cm. Spadix bisexual or male. Bisexual spadix: female zone proximal, 1–2.2 cm; ovary globose; style distinct; stigma punctate; ovules 3 or 4; male zone distal, 1.5–3.2 cm; synandria lax; occasionally with echinate neuter flowers. Male spadix: male zone 3–5 cm × 3–5 mm; synandria stalked, consisting of 2 or 3 anthers, each with 2 thecae dehiscing by apical slits. Appendix ascending, sigmoid, pale whitish, gradually tapering from sessile base to very acute apex, ca. 20 cm, 5–11 mm in diam. at base. Berries yellowish red or red, cylindric, ca. 5 mm. Seed usually 1, clavate. Fl. Apr–May, fr. Jul–Sep.

*Forests, thickets, grasslands; below 2700 m. Almost throughout China, except Xizang [Japan, Korea].*

**Arisaema yunnanense** Buchet var. *aridum* (H. Li) Gusman & L. Gusman.

Plants dioecious. Tuber nearly globose, 1–3 cm in diam. Cataphylls 2 or 3, to 17 cm. Leaves 1 or 2; petiole green, unmarked, 16–50 cm, proximal 1/4–1/2 sheathing into pseudostem; leaf blade petate; leaflets 5–9, pale greenish abaxially, green adaxially, linear to narrowly lanceolate, sessile; central leaflet 15–20 × 1–1.5 cm; lateral leaflets gradually smaller and shorter toward outermost, outermost ones 2–3 cm × 1–5 mm. Peduncle green, 10–50 cm, shorter or longer than petioles. Spathe yellowish green, 5–15 cm in total; tube narrowly cylindric, 2.2–6 cm × 4–20 mm, throat obliquely truncate, not recurved; limb suberect, ovate to narrowly ovate, 4–7 × 1–2 cm, apex acuminate. Spadix unisexual; female zone 1.2–2.5 cm; ovary whitish green, obvoid; ovules 3; stigma with short stipe;
male zone cylindric, 1.8–3 cm, densely flowered; synandria sessile, consisting of 2–4 anthers, each with 2 thecae dehiscing by apical pores. Appendix sessile, sigmoid or simply curved forward, yellowish green to violet, 4–17 cm × 2.5–4 mm. Fl. Apr–Jun.

- Grassy slopes, valley thickets along Jinsha Jiang; 1800–2800 m. NW Yunnan.

香南星 xiang nan xing

Plants monoecious or male. Tuber subglobose. Cataphylls 2 or 3, membranous. Leaves 1 or 2; petiole green to purplish, unmarked, 13–22 cm, basal 4–7 cm sheathing into pseudostem; leaf blade 3-foliolate; leaflets sessile, ovate to oblong, base cuneate, margin entire, apex acuminate. Inflorescence fragrant; peduncle green, nearly as long as petiole. Spathe white, 7–8 cm; tube funnelform, gradually opening to blade; limb ovate or oblong to narrowly oblong, 5.5–6 × 1.7–4 cm, apex acute to acuminate, bending forward. Spadix male or bisexual; female flowers green or cream-colored, congested in basal part of spadix; male flowers white. Appendix extremely fragrant, sessile, dull green, becoming orange, whip-shaped, 5–9 cm, bent down from throat of spathe. $2n = 22*$.  

- Humid grassy slopes at forest margins; ca. 1400 m. NC Yunnan (Dayao).

乌蒙南星 wu meng nan xing

Arisaema maireanum Engler; A. wumengense H. Li.

Plants dioecious. Tuber renewed seasonally, dark brown outside, whitish inside, depressed globose, ca. 3 × 4–5 cm. Cataphylls 2 or 3, greenish with pink and whitish blotches or whitish with brown apex, 17–18 × ca. 2.7 cm, papery, apex obtuse. Leaves 2; petiole green but sheathing part often with dark brown short stripes, 30–40 cm, proximally 25–30 cm sheathing into pseudostem, encircled in cataphylls; leaf blade pedate, 5–7-foliolate or palmate-digitate; leaflets sessile, base connected and closed, light green abaxially, dull green adaxially; central leaflet subsessile, elliptic to broadly oblong, base acute, apex acute or acuminate; lateral leaflets as central one but somewhat smaller, outermost ones ca. 8 × 3 cm. Peduncle green, unmarked or with whitish dots, usually shorter than petioles, 33–36 cm. Spathe emerging from pseudostem; tube greenish outside, white inside, unmarked, cylindric, ca. 4 × 1.4–2 cm, smooth, throat slightly recurved, not auriculate; limb white, unmarked, narrowly ovate, 9–11 × 3.7–5.5 cm, apex acute or acuminate, slightly incurved. Spadix unisexual; female zone greenish, conic, ca. 1.5 × 1 cm; ovary obvoid; style pyramidal, short; stigma small, papillose; male zone cylindric, 1.5–2 cm × ca. 3 mm; synandria dense, subsessile; anthers 2 or 3, yellowish, thecae globose, dehiscing by apical pores. Appendix sessile, dark green throughout or whitish in basal 2–3 cm, green in middle ca. 1.5 cm, dull brownish purple distally, cylindric, narrowed distally, ca. 14 cm in total, 3–5 mm in diam., part exserted from spathe tube recurved and pendulous, apex filiform. Fl. Jun–Jul.

- Forests, thickets; near sea level to 1100 m. E and N Taiwan.

A Chinese record of Arisaema thunbergii subsp. urashima (H. Har) H. Ohashi & J. Murata from Taiwan (J. C. Wang, Taiwania 37: 54–57. 1992) is referable to A. thunbergii subsp. autumnale.

心檐南星 xin yan nan xing

Arisaema brevistipitatum Merrill.

Plants dioecious. Tuber globose, 1–1.5 cm in diam. Cataphylls 2 or 3, ca. 5 cm, membranous. Leaf solitary; petiole 10–30 cm, slender, base forming short pseudostem; leaf blade pedate; leaflets (5–)7, sessile, light greenish, oblong, 7–10 × 1.5–3 cm, membranous, base broadly cuneate, apex acute to abruptly acuminate. Inflorescence emerging before leaf unfolds; peduncle 3–10 cm, slender. Spathe basically purplish; tube cream-colored, outside stained with purplish, inside dark purple, funnelform, 3–3.5 × 1–1.4 cm, throat margins broadly expanded to limb; limb broadly cordate, ca. 6 × 4 cm, apex acuminate and involute, surrounding spadix appendix. Spadix unisexual; female zone ca. 1 cm; ovary fusiform; male zone ca. 1 cm × 3 mm, shortly stipitate; synandria consisting of 2 anthers, thecae globose, dehiscing by apical pores. Appendix sessile, 15–27 cm, proximally fusiform, to 4 mm in diam., distally upright, exserted through involute apex of spathe limb, filiform. Fl. Apr.

- Guangdong, Guangxi.

*Dochafa* Schott, Syn. Aroid. 24. 1856.

Tuber subglobose. Leaves 1 or 2; leaf blade pedate. Spathe small; tube ovoid; limb incurved, ovate. Spadix bisexual and male. Appendix ellipsoid, small. Infructescence nodding.

One species: arid and cool areas at high elevations (2200–4000 m) in Africa, SW Asia (Arabian Peninsula), and the Sino-Himalayan region.

![Image of *Arisaema flavum*](image)

Plants monoecious and male. Tuber subglobose, 1.5–2.5 cm in diam. Cataphylls 3–5, green, 8–25 cm. Leaves 1 or 2; petiole green to purplish, unmarked, 11–35 cm, sheathing for ca. 4/5 length forming pseudostem; leaf blade pedate; leaflets 5–11(–15), sessile, glaucous abaxially, green adaxially, oblong-lanceolate or obovate-lanceolate, base cuneate, apex acuminate; central leaflet largest, 9–12 × 3–5 cm; outer (lateral leaflets) gradually decreasing to outermost (1.5–4 × 1–1.2 cm). Peduncle emerging from pseudostem, green, 15–30 cm. Spathe smallest in genus, 2.5–6 cm in total; tube yellowish green, ovoid to globose, 1.5–1 × 1–1.4 cm, constricted at dark purple throat with nectar inside; limb yellow or green, inside dark purple at least at basal part, oblong-ovate, 1.5–4.5 × 0.8–2 cm, apex acuminate, slightly incurved. Spadix bisexual or male, very short, 1–2 cm in total; female zone proximal, 3–7 × 5–7 mm; ovaries congested, greenish, obovoid; stigma sessile; male zone distal, light yellow, cylindric, 3–7 × 2–3 mm; synandria congested, usually consisting of 2 anthers; thecae sessile, dehiscent by apical pore. Appendix yellowish or yellow green, ellipsoidal, 2–5 × ca. 1.5 mm, very short, rugose when dry. Mature infructescence nodding, subglobose, ca. 4 cm in diam. Berries obovoid, 3–4 × 3–5 mm. Seeds 3, pale yellowish, 2–2.5 mm. Fl. May–Jun.

![Image of *Arisaema flavum*](image)

Rocky slopes, thickets, croplands, field sides; 2200–4400 m. W Sichuan, SE Xizang, NW Yunnan [Bhutan, NE India].

According to chromosome number and plant size, Murata (J. Jap. Bot. 65(3): 65–73. 1990) divided *Arisaema flavum* into three subspecies: subsp. *abbreviatum* (Schott) J. Murata (2n = 56, tetraploid) including C and W Himalayan (Afghanistan to Nepal) and Arabian (Oman) plants; subsp. *flavum* (2n = 56, tetraploid) including African and Arabian plants; and subsp. *tibeticum* (2n = 28, diploid) including plants from Bhutan, China, and NE India.

Underground stem a cylindric rhizome, branched. Leaves 2, pedate. Spathe auriculate at throat, long caudate at apex. Appendix stipitate, erect with truncate base, obtuse or narrowed at apex.

One species: SW China, NE India, Myanmar, Vietnam.

*Decipiens* xue li jian zu

*Arisaema guixiense* S. Y. Liu; *A. rhizomatum* C. E. C. Fischer; *A. rhizomatum* var. *mudum* C. E. C. Fischer; *A. rhizomatum* var. *viride* C. E. C. Fischer.

Rhizome cylindric, to 9 × 2.5 cm. Cataphylls 3 or 4, yellowish purple with dark brown or whitish spots, 2–15 cm. Leaves 2; petiole greenish or reddish with dark green or dark purple spots, 15–90 cm; leaf blade pedate, palmate; leaflets (3–)5–7, petiolulate, greenish and sometimes with purple spots abaxially, dark green adaxially, narrowly oblong to elliptic, base cuneate, apex acuminate; central leaflet with petioloadeveloped to 5 cm, blade 8–18 × 3–8 cm; outermost leaflets 5–6 × 1.5–2 cm. Spathe green, usually with dark purple dots; tube cylindric, white toward base, 4–6 × 1.5–2 cm, throat obliquely truncate, slightly outcurved; limb deep green, lanceolate to ovate-lanceolate, 4–9.5 × 3–3.5 cm, apex acuminate and caudate, tail 6–10 cm, curved forward. Spadix unisexual; female zone conic, 1.5–2 cm, 7–13 mm in diam. at base; ovary green, bottle-shaped; stigma sessile, purple; male zone 2–2.5 cm; synandria lax; anthers 2 or 3; thecae dehiscing by lateral slits. Appendix erect, green, usually with dark purple dots; subsp. *flavum* (2n = 56, tetraploid) including African and Arabian plants; and subsp. *tibeticum* (2n = 28, diploid) including plants from Bhutan, China, and NE India.

Evergreen forests, mossy forests, thickets, bamboo thickets, on and between rocks; 600–1600 m. Guangxi, Guizhou, Hunan, Sichuan, SE Xizang, Yunnan [NE India, Myanmar, Vietnam].

*Pistillata* hua nan xing zu

Plants with tubers, paradioecious. Phyllotaxy spiro-distichous. Leaves 1 or 2; leaf blade 3-foliolate or pedately multifoliolate.
Spadix unisexual; theca dehiscing by an apical elliptic or oblong slit; appendix erect, slightly exerted from spathe tube, cylindric, base nearly truncate and stipitate, apex obtuse.

About 57 species: E Asia, North America; six species (three endemic) in China.

1a. Spathé blade cuculate-galeate ........................................................................................................ 61. A. ringens

1b. Spathé blade flat, not cuculate-galeate.

2a. Underground stem obovoid, stoloniferous ............................................................................... 59. A. xuanweiense

2b. Underground stem a subglobose tuber, not stoloniferous.

3a. Tuber bluish green outside; leaf blade always 3-foliolate, glaucous abaxially, always entire; infructescence nodding ................................................................. 60. A. lobatum

3b. Tuber whitish outside; leaf blade pedate with 5 or more leaflets, or rarely 3-foliolate, usually not glaucous abaxially, occasionally serrate or dentate; infructescence upright.

4a. Pseudostem much shorter than petioles (except sheath part) ..................................................... 62. A. amurense

4b. Pseudostem longer than petioles.

5a. Leaflets usually 5–7; spathe tube funnelform, throat oblique, scarcely recurved ...................... 63. A. bockii

5b. Leaflets usually 3 or more; spathe tube cylindric, throat horizontal, narrowly recurved ........... 64. A. peninsulae

宣威南星 xuan wei nan xing

Plants dioecious. Rhizome vertical, 3–5 cm × 7–10 mm, producing stolons. Cataphylls 2 or 3, whitish green, 3–8 cm, membranous, acuminated at apex. Leaves 1 or 2; petiole greenish, 15–18 cm, proximally forming pseudostem; leaf blade 3-foliolate, pale green abaxially, green adaxially; leaflets sessile, serrate; central leaflet suborbicular, 8.8–11 × 6–8.5 cm, base obtuse, apex acute; lateral veins 5 per side, parallel, collective vein 2–3 mm from margin; leaflets obliquely ovate, 8.5–10.8 × 5.8–8.2 cm, base rounded, apex acuminate. Peduncle greenish, terete, to 18 cm. Spathé nearly erect, ca. 9.5 cm; tube green, cylindric, ca. 4 × 1.5 cm, basal ca. 1 cm white, throat obliquely truncate, straight or slightly recurved; limb green with whitish stripes, abaxially with a large (ca. 1 cm) oblong white area, incurred, ovate, ca. 5.5 × 4 cm, apex acuminate with a tail ca. 8 cm. Spadix unisexual; female zone cylindric or subglobose, 1–2 cm; ovary green, obovoid; style short; stigma sessile; appendix erect, whitish green, cylindric, ca. 35 × 3.5 mm in total, base subtruncate, ca. 5 mm in diam., stipitate; stipe ca. 3 × 2 mm. Male spadix unknown. Fl. Apr.

• About 2200 m. NE Yunnan (Xuanwei).

花南星 hua nan xing

Arisaema arisanense var. latiseptum Engler; A. lobatum var. rosthornianum Engler; A. onoticum Buchet; A. pictum N. E. Brown ex Hemsley.

Plants dioecious. Tuber depressed globose, 2–5 cm in diam. Cataphylls greenish to purplish. Leaves 2; petiole greenish and unmarked, 15–35 cm, proximal 1/3 sheathing into pseudostem; leaf blade 3-foliolate; leaflets sessile, glaucous abaxially, green adaxially, margin entire, apex long acuminate with a tail ca. 2 cm; central leaflet ovate-lanceolate to rhombic-elliptic, 16–22 × more than 10 cm, base cuneate; lateral leaflets obliquely ovate, 15–18 × 10–13 cm, apex filiform-caudate. Peduncle greenish, unmarked, shorter than petioles, to 25 cm. Spathé yellowish green to green; tube greenish, obovoid; style short; stigma disciform; male zone cylindric, 1.5–2.5 cm; synandria lax; anthers 2 or 3, stipeitate; theca violet, ovoid, dehiscing by apical pore. Appendix erect, pale green to whitish green, cylindric, middle slightly constricted, base truncate and stipitate, apex obtuse; stipe 6–8 mm. Infructescence nodding. Fl. Apr–Jul. 2n = 28*, 56*, 84*.

• Forests, thickets, grassy slopes; 600–3300 m. Anhui, Chongqing, Gansu, Guangxi, Guizhou, Hebei, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Shanxi, Sichuan, Yunnan, Zhejiang.

普陀南星 pu tuo nan xing

Plants dioecious. Tuber depressed globose, 2–5 cm in diam. Cataphylls greenish to purplish. Leaves 2; petiole greenish and unmarked, 15–35 cm, proximal 1/3 sheathing into pseudostem; leaf blade 3-foliolate; leaflets sessile, glaucous abaxially, green adaxially, margin entire, apex long acuminate with a tail ca. 2 cm; central leaflet ovate-lanceolate to rhombic-elliptic, 16–22 × more than 10 cm, base cuneate; lateral leaflets obliquely ovate, 15–18 × 10–13 cm, apex filiform-caudate. Peduncle greenish, unmarked, shorter than petioles, to 25 cm. Spathé yellowish green to green; tube yellowish green to green outside, purplish red with white or pale yellowish green striations inside, cylindric, gradually opening to an auriculate throat, 3–3.5 × 1–2 cm; limb concave and incurred, saccate, apex caudate. Spadix unisexual; female zone conic, ca. 1.8 × 1.2 cm; ovary greenish, obovoid; stigma sessile, pilose; male zone sessile, cylindric, ca. 1.5 cm × 8 mm; synandria sessile; anthers 2 or 3; theca globose, dehiscing by an apical pore. Appendix erect, white, narrowly conic, 2–6 cm × 5–10 mm, base truncate and stipitate, apex obtuse; stipe 3–10 mm. Infructescence erect. Fl. Apr. 2n = 28.

东北南星 *dong bei nan xing*

*Arisaema amurense* var. *robustum* Engler; *A. amurense* var. *violaceum* Engler.

Tuber depressed globose, 6–7 cm in diam. Leaves 2( or 3); petiole (5–)7–30 cm, proximal 3/4 sheathing and forming pseudostem; leaf blade 3-foliolate or pedately 5-foliolate; rachis between leaflets 0–6 cm; leaflets sometimes covered with fine whitish marks, obovate to narrowly oblong, 7–11 × 4–7 cm, base cuneate, margin entire or serrate, occasionally denticulate, apex acute; central leaflet with petiolule 5–25 mm; lateral leaflets remote from central one for 1–30 mm; outermost leaflets sessile, 9–15 cm, oblique, cuneate at base on inner side, auriculate or rounded on outer side. Peduncle shorter than petioles. Spathe greenish to dark purple, usually with pale purplish stripes; tube funnelform to cylindrical, ca. 5 cm, ca. 2 cm in diam. at throat, throat obliquely truncate, not auriculate; limb ovate-lanceolate to oblong, 3–4 cm, apex acuminate. Spadix unisexual; female zone subconic, ca. 1 cm in diam. at base; ovary obovoid; ovules 4; stigma spherical; male zone cylindrical, 2–3 cm; synandria lax, stipitate; anthers 2 or 3; thecae globose, dehiscing by apical pores. Appendix short, erect, cylindrical and robust, 3–5.5 cm × 4–5(–7) mm, base truncate, apex obtuse. Berries red, narrowly conic. Seeds 4, red, ovoid, smooth. Fl. May, mature fr. Sep. 2

灯台莲 *deng tai lian*

Tuber depressed globose, 2–5 cm in diam. Cataphylls 3, brownish with purple spots, 3–10 cm. Leaves 2; petiole 35–93 cm; pseudostem (sheathing part) 29–77 cm; leaf blade pedate; leaflets 7–17(–23); rachis well developed between terminal and lateral ones, and between lateral ones; leaflets narrowly elliptic, obovate lanceolate, or obovate-oblong, base cuneate, margin entire or serrate, apex acuminate; central leaflet with petiolule 1–4 cm, blade 9–18 × 3.5–9 cm, gradually smaller outward; lateral leaflets remote from central one for 1–4 cm, shortly petiolulate or sessile, ca. as large as central one; outer lateral leaflets sessile and much smaller than central leaflet. Peduncle erect, 30–80 cm. Spathe usually green with white stripes, or purplish to dark purple with whitish stripes; tube 5–8 × ca. 1.5 cm, throat obliquely truncate, scarcely recurved; limb incurved, usually green, or dark purple, oblong, 5–6 × 4–5 cm, apex acuminate. Spadix unisexual; female zone 1.5–3 cm × 5–7 mm; ovaries dense, narrowly ovoid; stigma short; stipe 4–5 mm. Berries reddish yellow, ovoid-globose, ca. 8 × 7 mm. Seeds 2 or 3, yellow-brown, ca. 4 mm in diam., rugose. Fl. May–Jun., mature fr. Sep. 2

细齿南星 *xi chi nan xing*

Tuber depressed globose, 1.5–5.5 cm in diam. Cataphylls 3, brownish with purple spots, 3–10 cm. Leaves 2; petiole 35–93 cm; pseudostem (sheathing part) 29–77 cm; leaf blade petate; leaflets 7–17(–23); rachis well developed between terminal and lateral ones, and between lateral ones; leaflets narrowly elliptic, obovate lanceolate, or obovate-oblong, base cuneate, margin entire or serrate, apex acuminate; central leaflet with petiolule 1–4 cm, blade 9–18 × 3.5–9 cm, gradually smaller outward; lateral leaflets remote from central one for 1–4 cm, shortly petiolulate or sessile, ca. as large as central one; outer lateral leaflets sessile and much smaller than central leaflet. Peduncle erect, 30–80 cm. Spathe usually green with white stripes, or purplish to dark purple with whitish stripes; tube 5–8 × ca. 1.5 cm, throat obliquely truncate, scarcely recurved; limb incurved, usually green, or dark purple, oblong, 5–6 × 4–5 cm, apex acuminate. Spadix unisexual; female zone 1.5–3 cm × 5–7 mm; ovaries dense, narrowly ovoid; stigma short; stipe 4–5 mm. Berries reddish yellow, ovoid-globose, ca. 8 × 7 mm. Seeds 2 or 3, yellow-brown, ca. 4 mm in diam., rugose. Fl. May–Jun., mature fr. Sep.

Forests; below 500 m. Heilongjiang, Henan, Jilin [Japan, Korea].

Chinese records of *Arisaema serratum* (Thunberg) Schott (e.g., in FRPS 13(2): 179. 1979) are referable to *A. peninsulae*.

细柄组 *xi bing zu*

Plants dioecious. Tuber subglobose. Phyllotaxy quincuncial. Leaves 1 or 2, petate or palmate. Spathe limb ovate or ovate-lanceolate, involute. Ovary bottle-shaped. Thecae dehiscing by lateral slits or by apical pores. Appendix erect or slightly incurved, narrowly cylindrical, thickened to base, stipitate.

Three species: Himalayas and Xizang-Qinghai plateau; three species (two endemic) in China.
1a. Spathe throat margin auriculate; leaflet apex long acuminate with tail ca. 6 cm
1b. Spathe throat margin oblique or slightly recurved; leaflet apex acuminate.

2a. Spadix appendix exserted from spathe throat, distally often suddenly recurved; leaflets 3(or 7 or 9) ... 65. A. jacquemontii
2b. Spadix appendix included in spathe tube, cylindric, erect; leaflets 3–6 ........................................ 66. A. wardii

65. Arisaema jacquemontii Blume, Rumphia 1: 95. 1835.

Arisaema spectabile, 1.2–3 cm in diam. Cataphylls 1 or 2, whitish, occasionally brown, to 20 cm, membranous, apex acute or obtuse. Pseudostem, petiole, and peduncle pale green, unmarked. Leaves 1 or 2; petiole (2.5–)20–52 cm, proximal 4/5 acute or obtuse. Pseudostem, petiole, and peduncle pale green, whitish, occasionally brown, to 20 cm, membranous, apex acuminate; central leaflet 7–18 × 2.5–7 cm; lateral leaflets 3–7 × 0.8–2.5 cm. Peduncle as long as petals. Spathe green outside, greenish inside; tube cylindric, 2.5–8 × 8–20 mm, throat obliquely truncate, not recurved; limb arching over spadix, ovate to narrowly ovate or oblong-triangular, 2.5–5(–9) × 1–2.5(–3.5) mm, apex acuminate into ascending filiform tail 2.5–6 cm. Spadix unisexual; female zone cylindric, 2.3–3.5 cm × 0.8–2.5 cm, inside, greenish, narrowly ovoid; synandria sessile, lax, cream-colored or tinged dark purplish; anthers 2–4, dehiscing by apical pores or slits. Appendix greenish proximally, purplish distally, 2–8 × ca. 1 mm, distal part emergent from spathe tube horizontally to decurved, tapering, base swollen, truncate at 3–5 mm in diam., slightly stipitate, smooth. Fl. Jun–Jul. 2n = 52.

Coniferous forests, open grassy places in forests. Juniperus or Rhododendron thickets, forest margins; 3000–4300 m. S Xizang [Afghanistan, Bangladesh, Bhutan, N India, Kashmir, Nepal, Pakistan].

Arisaema globosum, 1.5–2.2 cm in diam. Cataphylls 2 or 3, 9–10 cm, obtuse at apex. Petiole 12–25 cm, proximal 2/3 sheathing into pseudostem; leaf blade radiate to palmate; leaflets 3–6, sessile, oblong, 2–11 × 1–3 cm, base cuneate, apex acuminate, usually ciliate. Peduncle shorter or longer than petioles, 10–18 cm. Spathe green, unmarked or with whitish stripes; tube funnelform, 2–6.5 × ca. 1.5 cm, throat obliquely truncate, not auriculate, not recurved; limb triangular-ovate or ovate-lanceolate, 2–7 × 1.5–4 cm, apex acuminate and caudate with filiform tail 3–5 cm. Spadix unisexual; female zone cylindric, ca. 2.2 × 5–6 mm; ovary green, ovoid; style short; stigma spherical; male zone cylindric, 1.5–2.5 cm × 2–3 mm; synandria dense, sessile; anthers 2 or 3, dehiscing by lateral slits. Appendix erect, green, cylindric, 2–3.2 cm, 2.3–5 mm in diam. at base, base swollen and stipitate, apex obtuse; stipe 1.5–3 mm. Infructescence cylindric, ca. 5 × 1.5 cm. Berries yellowish red, ovoid, ca. 5 mm in diam. Seeds 1–3 pale brownish or brown, ovoid, reticulate rugose. Fl. May–Jul.

Coniferous forests, grassy places; 2400–4200 m. E Qinghai, S Shanxi, S Xizang, Yunnan.

Arisaema brevispathum Buchet; A. xiangchengense H. Li & A. M. Li.

Tuber subglobose, ca. 3 cm in diam. Cataphylls obtuse at apex. Leaves 1 or 2; petiole 40–70 cm, proximal half sheathing into pseudostem; leaf blade radiate to palmate; leaflets 6–9, usually 7, broadly oblong-lanceolate, base long cuneate, apex acuminate and caudate with filiform tail ca. 6 cm; central leaflet 10–25 × ca. 5.8 cm. Peduncle shorter than petals, 20–40 cm. Spathe green or distally dark brown with whitish stripes, 15–20 cm (including tail); tube cylindric, 5–10 × 1–2 cm, throat obliquely truncate, slightly recurved or not; limb suberect, ovate to ovate-lanceolate, 4.5–5 × ca. 3.5 cm, apex acuminate into filiform tail to 4–5 cm. Spadix unisexual; female zone 2.5–3 cm × 6–7 mm; ovules 5–9, bottle-shaped; male zone ca. 2 cm × 2.5 mm; synandria sessile; anthers 2. Appendix stipitate, ca. 9 cm in male spadix, 5–6 cm in female, base whitish, swollen, ca. 3 mm in diam. in male spadix, ca. 6 mm in diam. in female, gradually narrowed distally, apex exserted from tube, erect or recurved, dark brown, 1–1.5 mm in diam.

Coniferous forests, grassy places; 3500 m. Chongqing (Chengkou), Sichuan.

About 14 species: S and SE Asia, Himalayas; 11 species (seven endemic) in China.

1a. Apex of spadix appendix distinctly echinate or rugose; spathe margin entire.
1b. Apex of spadix appendix smooth, or rarely slender and slightly creased, or degenerate, if apex rugose

then spathe margin ciliate around throat.
4a. Spadix appendix degenerate; spathe limb ± erect, involute ......................................................... 68. A. exappendiculatum
4b. Spadix appendix terete, stipitate or not.
5a. Pseudostem and peduncle much shorter than petioles, inflorescence positioned just above ground .......... 69. A. zhui
5b. Pseudostem and/or petiole long, inflorescence distant from ground.

6a. Spathe basically yellow.
7a. Underground stem subglobose tuber; spathe not striped; (?neuter flowers absent; ?infructescence nodding) .......................................................................................... 76. A. jingdongense
7b. Underground stem subcylindric, longer than wide; spathe tube longitudinally striped with white and purple; neuter flowers present; infructescence upright ........................................ 75. A. muratae
6b. Spathe basically green or purple.
8a. Plants stoloniferous; spadix appendix upright or curved forward.
9a. Spadix appendix slender, frequently curved forward at apex; infructescence upright .......... 78. A. concinnum
9b. Spadix appendix cylindric; spathe margin ciliate around throat; infructescence nodding .......... 73. A. ciliatum
8b. Plants without stomata; appendix upright.
10a. Spathe tube cylindric, basically greenish, limb occasionally tinged with purple .......... 74. A. erubescens
10b. Spathe tube funnelform, usually purple outside, white inside .................................................. 70. A. sukotaiense

圈药南星  quan yao nan xing

Tuber depressed globose, 2–5 cm in diam., sometimes with thick creeping stolons. Cataphylls purple. Leaf solitary; petiole green, sometimes dark purple, 23–55 cm, proximally sheathing into pseudostem; leaf blade radiate; leaflets 7–13, sessile, oblanceolate, 8–22 × 2–4 cm, base cuneate, apex long acuminate. Peduncle green, sometimes purplish, much shorter than petioles. Spathe green, occasionally dark purple, slightly glaucous inside; tube pale green, without distinct stripes, cylindric, 2–7 × 1.2–2 cm, not broadened nor spreading at throat; limb suberect, ovate-lanceolate, 8–15 × 2.5–3 cm (at base), generally with inrolled margins, convolute, tapering into a long caudate apex 5–8 cm. Spadix unisexual, 1.5–3 cm including appendix; female zone ca. 1.2 cm in diam. at base; ovary green, turbinate, slightly angular, apex apiculate; stigma small; male zone 7–8 mm in diam. at base; synandria lax; anthers stipitate, circumscissile at apex. Appendix absent, or very rarely broadly cylindric, to 1.5 cm. Fl. May–Jun.

Forests on slopes, grasslands between forests; 2400–2500 m. S Xizang [Nepal].

维明南星  wei ming nan xing

Tuber depressed globose, 3–4 cm in diam., with a few tubercles around. Cataphylls, petiole, and peduncle greenish, unmarked. Cataphylls 2, membranous. Leaves 1 or 2; petiole 32–36 cm × 5–8 mm, basal 3–4 cm sheathing into pseudostem; leaf blade radiate; leaflets 11–13, sessile, pale green abaxially, green adaxially, narrowly elliptic, unequal, (including filiform tail) 1–1.5 × 1.1–2.2 cm. Peduncle emerging from pseudostem, much shorter than petioles, only ca. 7 cm. Spathe dark purple, with whitish stripes; tube whitish green inside, funnelform, short, ca. 3.8 × 1.5 cm, gradually opening to throat, throat obliquely truncate, not recurved; limb incurved, purple-green with indistinct stripes outside, dark purple with greenish stripes inside, triangular-ovate, 6.5–9 (male) × ca. 4 cm, apex abruptly acuminate and long caudate with filiform tail ca. 2 cm (female) to 4.5 cm (male). Spadix unisexual; female zone ca. 1.5 cm; ovaries dense, green, ovoid-globose; ovules 4, basal, erect; stigma subsessile, punctate; male zone ca. 2.4 cm × 3–4 mm; synandria dense, subsessile; anthers 2–6, violet, globose, dehiscing by apical pores. Appendix yellowish or greenish, with tiny purple dots, cylindric, distally slightly swollen, 3–3.6 cm × 3–6 mm, base truncate with purple stipe ca. 5 mm, apex obtuse. Fl. Jun.

● About 4000 m. NW Yunnan (Dêqên: Meili Xueshan).

中泰南星  zhong tai nan xing

Plants deciduous. Tuber subglobose, cream-colored, 3–4 × 5–7 cm. Cataphyll pink, with brown mottling, 1–20 cm. Leaf solitary; petiole red-brown or olive-green with transverse paler mottling, 60–80 cm, proximal 35–45 cm forming pseudostem, ca. 1.5 cm in diam. at base; leaf blade radiate; leaflets 12–14, sessile to subsessile, glaucous with slightly prominent carmine or green veins abaxially, shiny green adaxially, elliptic, 20–30 × 3–4 cm, base cuneate, margin flat or undulate, green or red, apex acuminate, often prolonged into a carmine thread to 9 cm; veins slightly impressed adaxially. Peduncle green with paler mottling, becoming red-violet toward inflorescence, shorter than petioles, 35–60 cm × 4–5 mm. Spathe tube outside pruinose, dark purple or pale olive-green with thin white stripes, inside pale carmine with white stripes, funnelform, 7–8 cm, 1.2–1.5 cm in diam. at base, 3–4.5 cm in diam. apically; throat margins straight, dark carmine; limb horizontal, outside dark purple, with very faint paler stripes, inside dark purple, pale green at base, with broad white stripes Anastomosing in a central white spot at throat level, ovate, 9–10 × 5–6 cm, nearly as long as tube, apex acuminate, prolonged into a purple, filamentosus tail to 20 cm. Spadix unisexual; female zone of same shape and size as male zone; ovaries dense, pale green, bottle-shaped, 1.5–2 mm in diam.; stigma sessile, penicillate, surrounded by black annulus; male zone subcylindric, 2–3 × ca. 0.6 cm; synandria loosely arranged, consisting of 2–4 anthers; anthers lilac, subsessile or borne on a white-green short stalk; theca dehiscing by an oblong pore; pollen white. Appendix sessile, slightly exerted from spathe tube, erect, cylindric, to 7 cm × 5 mm, middle part green sometimes with carmine.
stripes above neuter flowers, apex white-green, rounded, even or spongy; neuter flowers upcurved, green, 3–4 mm, numerous in female spadix only. Inflectuence cylindric, ca. 5 × 1.5–2.5 cm, borne on a nodding peduncle. Berries dense, red-orange with black stigmatic remains, ca. 7 × 3 mm, 1- or 2-seeded. Seeds globose, ca. 2 mm; testa cream-colored. Fl. May–Jun.

Mountain forests along roadides, sometimes growing as an epiphyte on mossy tree trunks; 1200–2500 m. S Yunnan [N Thailand].

Tuber depressed globose, 2–4 cm in diam. Cataphylls 2, green, 4–20 cm. Cataphylls, petiole, and peduncle green, unmarked. Leaf solitary, petiole ca. 30 cm, basal ca. 6 cm sheathing into pseudostem; leaf blade radiate; leaflets 7–11, sessile, glaucous abaxially, green adaxially, narrowly elliptic or oblancoate, unequal, attenuate to base, apex long acuminate, sometimes caudate with a short filiform tail; central leaflet ca. 12.5 × 2.8 cm; outer leaflets 7–8.5 × ca. 1.4 cm. Peduncle emerging from petiole sheath, much shorter than petioles, ca. 17 cm. Spathe green, not marked by spots or stripes; tube cylindric, ca. 5.5 × 1.5 cm, slightly recurved at throat; limb slightly outcurved at base, otherwise incurved, ovate, ca. 8 × 5 cm, long caudate, with filiform tail to 8 cm. Spadix unisexual; female zone conic, ca. 1.8 cm × 7 mm, flowers dense; male zone narrowly conic, 2–3 cm, 3–5 mm in diam. at base; synandria lax, shortly stipitate; anthers 2 or 3, yellow, dehiscing by apical pores. Appendix erect, violet, occasionally greenish, cylindric, 3.2–5.5 cm × 3–4 mm, gradually narrowed to base, apex obtuse and verrucose, with acute neuter flowers on proximal part. Inflectuence nodding. Fl. Jun.

Forested slopes; 2600–3100 m. S and SE Xizang (Gyirong, Nyenting, Zayu), W Yunnan (Baoshan, Gaoligong Shan, Lijiang) [Bhutan, India (Sikkim), Nepal].

Himalayan plants differ from those in Gaoligong Shan in having the spathe green, white striped outside, and dark purple inside.

Arisaema ciliatum var. liubaense Gusman & Gouda.

Tuber depressed globose, 2–2.5 cm in diam., stoloniferous. Cataphylls 3, 10–20 cm, membranous. Cataphylls, petiole, and peduncle green, occasionally purplish, unmarked. Leaf solitary; petiole 20–70 cm, basal 15–40 cm sheathing into pseudostem; leaf blade radiate; leaflets 11–14, sessile, narrowly elliptic, base cuneate, apex acuminate and caudate. Peduncle shorter than petioles, 20–50 × 1.2–1.4 cm. Spathe purple or dark purple, with numerous white stripes, or green; tube cylindric, 4.5–5 × 1–1.2 cm, throat obliquely truncate, not auriculate, ciliate; limb suberect to incurved, narrowly lanceolate, 4.5–5.5 × 2.1–4 cm, apex long acuminate and caudate with violet filiform tail 2–5 cm. Spadix unisexual; female zone conic, ca. 1.5 cm, ca. 7 mm in diam. at base; ovary green; style conic; stigma purple, punctate; male zone narrowly conic, 2–3 cm, ca. 3 mm in diam. at base; synandria lax, shortly stipitate; anthers 2 or 3, yellow, dehiscing by apical pores. Appendix erect, violet, occasionally greenish, cylindric, 3.2–5.5 cm × 3–4 mm, gradually narrowed to base, apex obtuse and verrucose, with acute neuter flowers on proximal part. Inflectuence nodding. Fl. Jun.

Forest, thicket; 2900–3300 m. NW Yunnan (Lijiang).

缘毛南星 yuán máo nán xīng

Arisaema ciliatum var. liubaense Gusman & Gouda.

Tuber depressed globose, 2–2.5 cm in diam., stoloniferous. Cataphylls 3, 10–20 cm, membranous. Cataphylls, petiole, and peduncle green, occasionally purplish, unmarked. Leaf solitary; petiole 20–70 cm, basal 15–40 cm sheathing into pseudostem; leaf blade radiate; leaflets 11–14, sessile, narrowly elliptic, base cuneate, apex acuminate and caudate. Peduncle shorter than petioles, 20–50 × 1.2–1.4 cm. Spathe purple or dark purple, with numerous white stripes, or green; tube cylindric, 4.5–5 × 1–1.2 cm, throat obliquely truncate, not auriculate, ciliate; limb suberect to incurved, narrowly lanceolate, 4.5–5.5 × 2.1–4 cm, apex long acuminate and caudate with violet filiform tail 2–5 cm. Spadix unisexual; female zone conic, ca. 1.5 cm, ca. 7 mm in diam. at base; ovary green; style conic; stigma purple, punctate; male zone narrowly conic, 2–3 cm, ca. 3 mm in diam. at base; synandria lax, shortly stipitate; anthers 2 or 3, yellow, dehiscing by apical pores. Appendix erect, violet, occasionally greenish, cylindric, 3.2–5.5 cm × 3–4 mm, gradually narrowed to base, apex obtuse and verrucose, with acute neuter flowers on proximal part. Inflectuence nodding. Tuber depressed globose, 2–7 cm in diam. Cataphylls 3, dark green, with whitish striae or spots, to 55 cm, acute at apex. Petiole and peduncle green, smooth, unmarked. Leaf solitary, occasionally 2; petiole to 100 × ca. 2 cm, proximal ca. 50 cm sheathing into pseudostem; leaf blade radiate; leaflets 18–23, sessile, green abaxially, dull green adaxially, narrowly elliptic or narrowly linear, 16–28 cm × 2–20 mm, base cuneate, apex long acuminate and caudate, with filiform tail 7–10 cm; veins raised abaxially, impressed adaxially; lateral veins numerous, obliquely ascending. Peduncle shorter than petioles, to 75 cm, free part ca. 9 cm. Spathes green, with indistinct whitish stripes or not; tube cylindric, 6–7 × ca. 1.5 cm, auriculate and recurved
at throat; limb deep green sometimes with purple margin outside, pale green inside, triangular-ovate, 8–12 × 4–8 cm, apex acuminate with long purple filiform tail, arching; tail to 35 cm, pendulous. Spadix unisexual; female zone conic, ca. 3.5 × 1.5 cm; ovary green, obovoid; stigma sessile, spherical, pilose; male zone cylindric, 4–4.5 cm × 4–5 mm; synandra dark violet; anthers sub sessile, 2 or 3, dehiscent by apical pores. Appendix pale green, cylindric or narrowly conic, ca. 7 cm × 2–4 mm, with some acute flowers at base. Inflorescence nodding. Berries red. Fl. Jun–Jul.

Pinus forests, mixed forests, thickets, grassy slopes, lakesides, between rocks; below 3200 m. Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hebei, Henan, Hubei, Hunan, Jiangxi, Shaanxi, Shandong, Shanxi, Sichuan, Taiwan, Yunnan, Zhejiang [Bhutan, NE India, Laos, Myanmar, Nepal, N Thailand, Vietnam].

H. Hara (Bull. Univ. Mus. Univ. Tokyo 2: 321–354. 1971) noted that Arisaema consanguineum is characterized by having a threadlike appendage at the apex of the leaflets and spathe (but sometimes absent), a sessile spadix appendage with neuter flowers at least in the female spadix, and a nodding inflorescence, whereas A. erubescens lacks a threadlike appendage on the leaflets and spathe, has a stipitate spadix appendage without neuter flowers, and has an upright inflorescence. In the present treatment, we follow many Chinese florists in recognizing a wide range of variation for Chinese A. erubescens including both types of plants. One of us (Murata), until recently, considered that only true A. consanguineum is distributed in China, but he found the second type of plants, which share some characteristics with A. erubescens, north of Kunming City. However, these plants have a threadlike appendage on the leaflets and spathe and do not fit true A. erubescens (nor A. consanguineum in the strict sense) and could represent a new species. A revision of the whole A. erubescens-A. consanguineum group is now required.

邑田南星 yi tian nan xing

Plants to 1 m tall and 50 cm in diam. Tuber green and brown outside, subcylindric, ca. 5 × 5–6.5 cm, with short globose offsets. Cataphylls olive-green or pink with dark and pale transverse markings, to 50 cm. Leaf usually solitary; petiole similar in color and pattern to pseudostem, cylindric, to 80 cm, proximally forming pseudostem to 40 × ca. 3 cm, green with cream-colored stripes and transverse vermicular markings; leaf blade radiate, with up to 11 segments; leaflets sub sessile or shortly petiolulate, glaucous abaxially, shiny green adaxially, elliptic, 20–25 × 6–7 cm, base cuneate, margin undulate, green, entire or serrate, apex long acuminate; veins deeply impressed adaxially. Inflorescence emerging when leaf unfolds and carried beneath foliage; peduncle olive-green, flushed pink and purplish green apex, to 55 cm, shorter than petioles, ca. 1 cm in diam. at base. Spathe tube carmine outside with longitudinal pale stripes, with white ring at base and yellow-green near throat, yellow-green inside with dotted purple stripes mainly in proximal half, cylindric, broad recurved at throat margin, to 8 × ca. 1.8 cm, at middle ca. 1.2 cm in diam.; limb horizontal, slightly translucent, yellow-green with paler veins both outside and inside, yellow at apex and turning carmine at tip, lanceolate, ca. 5 × 4 cm, shorter than tube, acuminate to 15 cm. Spadix unisexual; female zone slightly conic, 2–3 × 1–1.5 cm; ovaries dense, pale yellow-green, bottle-shaped, 1-loculed; ovules ca. 3, basal, fusiform; stigma sessile, white, penicillate; neuter flowers absent or few in male spadix, numerous in female, located just above fertile part, upcurved, stiff, ca. 5 mm; male zone cylindric to slightly conic, 4–5.5 × 1–1.3 cm; synandra dense, each consisting of 2–4 anthers, stalked; thecae purple proximally and carmine distally, dehiscent by elongated pores; pollen blue; appendix sessile, slightly protruding from spathe tube, whitish with carmine longitudinal stripes, obscurely crimson and wrinkled at apex, cylindric, clavate, 4–5 cm in male spadix, 5–6 cm in female, ca. 4 mm in diam. at base, ca. 7 mm in diam. at apex. Inflorescence borne on upright peduncle, cylindric, ca. 10 × 4 cm; rachis pale pink. Berries dense, red-orange, ca. 14 × 8 mm, distally rounded and smooth, up to 3-seeded. Seeds globose, ca. 6 mm in diam.; testa gray.

Evergreen broad-leaved forests; 1200–2400 m. Yunnan (Yingxiang).

景东南星 jing dong nan xing

Arisaema cangshanense X. D. Dong.

Tuber subglobose, ca. 2.5 cm in diam. Cataphylls 3, pale green with purple spots, to 30 cm. Leaf solitary; petiole greenish, unmarked, ca. 65 cm, proximal 3/4 sheathing into pseudostem; leaf blade radiate; leaflets 7, sessile, pale green abaxially, deep green adaxially, oblong-lanceolate, 7–8 × 1–1.6 cm, margin entire, apex acuminate. Peduncle shorter than petioles, ca. 55 cm × 2.5–3.3 mm. Spathe yellowish, without white stripes; tube cylindric, ca. 4 cm × 9 mm, recurved at throat; limb arching, triangular-oblong, ca. 7.5 × 3 cm, apex acuminate with a filiform tail 4–5 cm. Spadix unisexual; male zone ca. 3 cm; synandra dense; appendix hidden in spathe tube, orange-yellow, clavate, ca. 3.5 cm × 4 mm, smooth, apex obtuse. Female spadix unknown. Fl. Jun.

Evergreen broad-leaved forests; 2400–2500 m. Yunnan (Diancang Shan, Jingdong).

蓬莱南星 peng lai nan xing

Tuber depressed globose, 2–6 cm in diam. Cataphylls greenish or reddish, often with purple-brown marks. Leaf solitary; petiole white or pale green, usually mottled with purple-brown marks, 12–70 cm, proximal 2–30 cm sheathing into pseudostem; leaf blade radiate; leaflets 7–15, glaucous abaxially, green adaxially, obovate, apex filiform, caudate, with a threadlike pendulous tail at tip. Peduncle distinctly shorter than petioles, 3–45 cm. Spathe purplish red to dark purple, with fine green dots between veins outside; tube white or pale yellowish green with purple stripes inside, obconic, gradually opening to auriculate throat, 2–6 × 3.7–8 cm; limb dark purple, ovate to broadly ovate, 3–8 × 3.5–8 cm, scarcely with pale veins on inner surface, apex acute to acuminate with a prolonged filiform tail to 40 cm. Spadix 3–10 cm including appendix, unisexual; female zone conic, 2.8–3 cm × ca. 12 mm, base
narrower, with abundant aculeate neuter flowers, apex slightly enlarged, strongly rugose; male zone cylindric, ca. 4 cm × 7 mm; synandria consisting of 3 or 4 subsessile anthers; appendix sessile, whitish distally, broadly cylindric, 1.7–7 cm × 4–13 mm, strongly or weakly rugose at apex. Fl. May–Jun.

- Common throughout the island; middle elevations. Taiwan.

1a. Peduncle 10–45 cm, 5–15 cm exserted from pseudostem; petiole and peduncle mottled with purple-brown marks; spadix appendix 5–7 cm. ........................................ 77a. var. taiwanense

1b. Peduncle 3–15 cm, 1–5 cm exserted from pseudostem; petiole and peduncle unmarked; spadix appendix 1.8–2.5 cm. ............. 77b. var. brevipedunculatum

77a. Arisaema taiwanense var. taiwanense
蓬莱南星 (原变种) peng lai nan xing (yuan bian zhong)

Cataphylls, petiole, and peduncle mottled with purple-brown marks. Peduncle 10–45 cm, 5–15 cm exserted from pseudostem. Spathe tube 3.8–5 × 5–8 cm when opened; limb weakly concave and arched, 5–7 cm except for threadlike tip, 4–6.5 cm wide. Spadix appendix 5–7 cm × 4–13 mm. Fl. May. 2n = 28*.

- Taiwan.

短梗蓬莱南星 duan geng peng lai nan xing

Cataphylls, petiole, and peduncle unmarked. Peduncle 3–15 cm, 1–5 cm exserted from pseudostem. Spathe tube 2–4 × 3.7–6 cm when opened; limb concave and arched, 3–5 cm except for threadlike tip, 3.5–7 cm wide. Spadix appendix 1.8–2.5(–3.5) cm × 4–8 mm. Fl. May–Jun.

- Middle elevations. E and S Taiwan.

78. Arisaema concinnum Schott, Bonplandia (Hannover) 7: 1859.
皱序南星 zhou xu nan xing

Tuber depressed globose, to 5 cm in diam., stoloniferous. Cataphylls 3, 10–20 cm, membranous. Leaf solitary; petiole and peduncle 30–50 cm, proximal 20–30 cm forming pseudostem, green or purplish, scarcely marked; leaf blade radiate; leaflets 7–13, sessile, oblong to elliptic, base cuneate, apex acuminate and caudate. Peduncle shorter than petioles, 15–20 cm. Spathe dark purple or green, with longitudinal white stripes; tube cylindric, 4–8 × 1.5–2 cm, throat obliquely truncate, not auriculate; limb ovate to deltoid-ovate to narrowly deltoid-ovate, 2–4 cm wide, apex long acuminate and caudate, to 15 cm including filiform tail. Spadix unisexual; female zone conic, 1.5–2 cm, 7–10 mm in diam. at base; ovary green; male zone narrowly conic, 2–3 cm; synandria lax; anthers 2 or 3, dehiscing by apical pores; appendix erect, dark purple or green, narrowly cylindric-clavate, 4–7 cm × 2–4 mm, apex bent forward and verrucate. Infructescence upright. Fl. Jun.

- Alpine meadows; 2000–3500 m. Xizang.

Incompletely known species

南漳南星 nan zhang nan xing

Tuber globose. Cataphylls 7–10 cm, obtuse and cuspidate at apex. Leaves 2; petiole slender, ca. 20 cm, proximal ca. 15 cm sheathing; leaf blade pedate; leaflets 7, lanceolate, 14–20 × 5.5–6 cm, entire, acuminate; central leaflet shortly petiolulate, larger than lateral ones. Peduncle ca. 15 cm, nearly equaling sheath. Female zone in spadix ca. 2 cm (in fruit), shortly stipitate; appendix ca. 3.5 cm.

- Humid places. Hubei (“Nangqiang”).

泉七属 quan qi shu

Li Heng (李恒 Li Hen); Peter C. Boyce

Herbs, medium sized to robust, latex-bearing, usually evergreen, sometimes seasonally dormant. Stem epigeal, erect or creeping, stout, covered with fibrous remains of leaves and cataphylls. Leaves solitary or few to several together; petiole sheath very short; leaf blade peltate, ovate or ovate-oblong, base often emarginate, apex acuminate; basal veins short, well developed, primary lateral veins pinnae, forming a submarginal collective vein very near margin, marginal vein also present, secondary and tertiary laterals arising from primaries at a wide angle, then arching toward leaf margin and forming a ± conspicuous interprimary collective vein, higher order venation reticulate. Inflorescence solitary; peduncle shorter than petioles. Spathe barely convolute at base, ± fully expanded at anthesis, yellow, yellow and red or ± dark purple within, ovate or ovate-lanceolate, not constricted, apex acuminate; basal part persistent to fruiting stage; apical part becoming reflexed and revolute, marcescent. Spadix much shorter than spathe, densely flowered; female zone cylindric, often longer than male zone, mostly adnate to spathe; male zone contiguous with female zone, cylindric, ellipsoid, or subglobose, fertile to apex, obtuse. Flowers unisexual, naked. Gynoecium surrounded by whorl of 2–5 short, claviform staminodes, more rarely staminodes absent; ovary subglobose to ovoid, 1-loculed; ovules numerous, hemiorthotropous; funicle distinct; placenta 2–5, parietal, in basal part only or extending from base to apex, defined stylar region ± lacking; stigma strongly 2–
5-lobed. Male flowers 3–6-androus; stamens connate into a strongly lobed, apically truncate synandrium; common connective relatively small, impressed at apex; thecae contiguous, oblong, dehiscing by apical pore. Fruit ovoid, many seeded. Seeds ovoid to ellipsoid; testa costate; embryo axile, conic, short; endosperm copious.

About nine species: tropical and subtropical Asia; four species in China.

1a. Spathe inside concolorous purple .................................................. 3. *S. kerrii*

1b. Spathe inside variously yellow.

2a. Spathe inside greenish yellow, inside basal half brownish; stigma 2-lobed .............................................. 4. *S. henryana*

2b. Spathe inside golden yellow with or without a red basal patch; stigma entire or 4- or 5-lobed.

3a. Female flowers with associated staminodes, stigma 4- or 5-lobed; leaves paler but not glaucous abaxially .......................................................... 1. *S. colocasiifolia*

3b. Female flowers without associated staminodes, stigma entire; leaves strikingly white glaucous abaxially ............................................... 2. *S. griffithii*

2. *Steudnera griffithii* (Schott) Schott, Bonplandia (Hannover) 10: 222. 1862.

广西泉七 guang xi quan qi

*Gonatanthus peltatus* Van Houtte.

Stem short, creeping and ascending; persistent cataphylls brown, not netted. Petiole green, cylindric, 30–50 cm, slender, base sheathing; leaf blade paler but not glaucous abaxially, green adaxially, ovate or obovate, 20–30 × 12–17 cm, subleathery, base obtuse, apex acuminate or acute. Peduncle green or violet, much shorter than petioles, 8–15 cm. Spathe reflexed, concolorous yellow, ovate-lanceolate or oblong-lanceolate, 10–15 × 5–7 cm, apex long acuminate. Spadix 3–4 cm; female zone cylindric, 1–1.5 cm × 5–6 mm, adnate to spathe; ovary subglobose, stigma 4- or 5-lobed, mixed with clavate staminodes; male zone ellipsoid, 1–1.5 cm × 5–6 mm, obtuse. Fl. Mar–Apr.

Dense forests, wet meadows, by streams; 600–1400 m. Guangxi, Yunnan [Bangladesh, NE India, N Laos, N Myanmar, N Thailand, N Vietnam].

The poisonous stem is used to treat injuries, cuts, snake and insect bites, vasculitis, and skin ulcers.

2. *Steudnera griffithii* (Schott) Schott, Bonplandia (Hannover) 10: 222. 1862.

全缘泉七 quan yuan quan qi

*Gonatanthus griffithii* Schott, Prodr. Syst. Aroid. 143. 1860.

Stem creeping, 10–20 cm, 3–10 mm in diam. Petiole 25–30 cm; leaf blade strikingly white glaucous abaxially, pale green adaxially, ovate-oblong, 10–25 × 6–15 cm, base emarginate or shortly 2-lobed, apex acute or cuspidate. Peduncle ca. 12 cm. Spathe reflexed, yellow-green on both surfaces, brown-purple below middle inside, 7–10 × 2.8–3 cm. Spadix 2–3.5 cm; female zone 15–25 × 1–2 mm, ca. 2/3 of length adnate to spathe; ovary without staminodes; stigma entire; some sterile flowers on distal part of female zone; male zone cylindric, ellipsoid, 5–6 mm. Berry yellowish green, broadly obovoid-cylindric, apex with persistent stigma, 1-loculed. Seeds 4–12. Fl. Mar–Jun.

Open forests, brushwood in valleys, wet places; 100–500 m. SE Yunnan [NE India, Myanmar].

滇南泉七 dian nan quan qi

Herbs, evergreen. Stem rhizomatous, epigeal, erect, later decumbent with age, 2–40 × 1–1.5 cm, densely covered with tattered cataphyll and leaf remains, older parts eventually naked. Leaves solitary to several together at shoot tips; petiole pale green, terete, 35–40 cm × 3–7 mm, sheath very short; leaf blade strongly glaucous abaxially, deep olive-green adaxially, peltate, ovate, 10–35 × 8–14 cm, membranous, base emarginate, sinus very shallow, posterior lobes almost absent, apex cuspidate. Inflorescence solitary, very strongly fragrant of naphtha; peduncle mid-green, terete, 6–12 cm. Spathes outside deep yellow, inside deep purple, lanceolate, 9–10 × 2–5 cm, reflexed on opening, apex long acuminate, distal part soon withering, marcescent, proximal part persistent into fruiting. Spadix ca. 2.5 cm × 5 mm; female zone pale creamy white, cylindric, dorsally adnate to spathe; pistil subglobose, 2–3 mm high, 0.5–1 mm in diam.; style very short; stigma 4-lobed, exceeding style width, style and stigma tinged purple; male zone pale creamy white, clavate, free; synandria 4–6-androus, 1–2 mm high, 1.5–2.5 mm in diam., 10–16-lobed, shortly stipitate. Inflorescence consisting of few to many berries partially covered by persistent spathe base. Berry ripening dull red, ovoid, 6–11 × 4–7 mm.

Wet areas in seasonal evergreen forests, almost always associated with limestone; 400–600 m. SW Guangxi [N Thailand, N Vietnam].

One of us (Boyce) has collected *Steudnera kerrii* on the Chinese border in N Vietnam. The population almost certainly extends into adjacent Guangxi.

Herbs, evergreen, medium sized, to 45 cm. Stems short, densely covered with fibrous cataphyll remains. Leaves few together at shoot tips; petiole mid-green, terete, 30–45 cm × 4–5 mm, sheath very short; leaf blade slightly paler abaxially, mid-green adaxially, peltate, somewhat stiffly membranous, base sometimes somewhat truncate, apex acuminate. Inflorescence solitary, rarely paired; peduncle pale green, terete, 8–15 cm. Spathes golden yellow, inside with a red patch, ovate to ovate-lanceolate, 5–8 × ca. 4 cm, apex cuspidate-acuminate.
Spadix up to 2.3 cm; female zone cylindric, ca. 15 × 3 mm, dorsally adnate to spathe; pistil mid-green, depressed globose, ca. 2 mm in diam.; style very short; stigma pale yellow, 2-lobed, exceeding style; staminodes 4 or 5 per pistil, white, shorter than pistil, stoutly spatulate and very shortly apiculate; male zone ivory, bluntly cylindric, free; synandria 6- or 7-androus, ca. 2 × 3.5 mm. Inflorescence and fruit unknown.

Wet shaded areas in seasonal evergreen forests, habitually on limestone; 300–700 m. Yunnan [N Laos, N Vietnam].

岩芋属 yan yu shu
Li Heng (李恒 Li Hen); Peter C. Boyce

Gonatanthus Klotzsch.

Herbs, small to medium sized, seasonally dormant, epiphytic or epilithic, rarely terrestrial, latex-bearing. Tuber subglobose, producing erect to spreading, unbranched or branching stolons from axils of scarious, deciduous cataphylls; stolons producing small, ovoid tubercles at nodes, each invested by numerous apically hooked scales (minute cataphylls). Leaves 1 or 2; petiole sometimes slender, sheath relatively short; leaf blade peltate, cordate-lanceolate to cordate-ovate, apex acuminate; basal veins well developed, primary lateral veins pinnate, forming submarginal collective vein very close to margin, marginal vein also present, secondary and tertiary lateral veins arising from primaries at a wide angle, then arching toward leaf margin and forming inconspicuous interprimary collective veins, higher order venation reticulate. Inflorescences solitary or up to 3 together, appearing with or without leaf; peduncle shorter than petioles. Spathe strongly constricted between tube and blade, sometimes with secondary constriction above spadix (this group formally recognized as a separate genus: Gonatanthus); tube with convolute margins, persistent, enclosing female zone and sterile zone of spadix; limb yellow or red, longer than tube, fully expanded or remaining convolute and opening only at base, sometimes becoming reflexed (in Remusatia vivipara and R. yunnanensis), later deciduous. Spadix sessile or subsessile, much shorter than spathe; female zone subcylindric, ca. 1/2 as long as spathe tube, separated from male zone by much narrower zone of sterile male flowers; male zone ellipsoid or subovate, fertile to apex, obtuse. Flowers unisexual, naked. Male flowers 2- or 3-androus; stamens connate into cuneate-clavate, 4–6-sulcate synandrium; fused filaments distinct; common connectives somewhat protruding at apex; thecae 4–6, oblong to ellipsoid, dehiscing by apical porelike slit; synandrodes each ± elongated. Pistils lacking associated staminodes; ovary subcylindric to subglobose, 1-loculed or partially 2–4-loculed at apex; ovules many, hemiorthotropous; funicle short to long; plagiozamy 2–4 and parietal or placenta 1 and basal; stylar region very shortly attenuate or appearing lacking; stigma disciform-scapitate or slightly 3- or 4-lobed. Fruit an obovoid to globose, many-seeded berry; inflorescence ellipsoid, borne within persistent spathe tube. Seed ellipsoid to subglobose, covered by thick, fleshy sarcotesta or testa verruculose to irregularly costate; embryo axile, ovoid to subglobose, short; endosperm copious. 2n = 28, 42.

Four species: S and SE Asia, one (Remusatia vivipara) extending from Africa and Madagascar to tropical Asia, Australia, and the Pacific islands; four species (one endemic) in China.

1a. Spathe with 2 constrictions, 1 separating tube and limb, 1 separating limb into 2 parts, proximal part subglobose, distal part narrowly lanceolate, apex long acuminate ................................................................. 4. R. pumila
1b. Limb of spathe with only 1 constriction separating tube and limb.
   2a. Bulbiferous stolons erect, simple, stout ............................................................ 1. R. vivipara
   2b. Bulbiferous stolons creeping or pendulous, simple or much branched, slender.
      3a. Limb of spathe semispreading to erect, not reflexed ........................................... 2. R. hookeriana
      3b. Limb of spathe initially erect, later spreading and soon reflexed .......................... 3. R. yunnanensis

Arum viviparum Roxburgh, Hort. Beng. 65. 1814 ["viviparum"]; Caladium viviparum (Roxburgh) Nees; Colocasia vivipara (Roxburgh) Thuwates; Remusatia bulbifera Vilmorin; R. formosana Hayata.

Tuber depressed globose, 2–4 × 3.5–5 cm; stolons erect, simple, stout; bulbils ellipsoid, 0.5–2.5 mm, stout; bristles to 1.5 mm, stout. Cataphylls 4 or more, brownish, broad, concealing peduncle, ca. 15 × 3 cm. Petiole 19–42 cm, proximal 1/4 sheathing; leaf blade glossy on both sides, pale green abaxially, green adaxially, oblong-ovate or lanceolate, 11–33 × 7–19.5 cm, sinus 1.5–3 cm; intramarginal vein indistinct. Flowering before leaves develop. Peduncle 6–12 cm. Spathe tube green outside, 3–5 × 1.3–2 cm; limb initially erect, later reflexed, yellow inside, obovate, 5.3–11.5 × 2.5–9 cm, narrowed to base, apex acute, apiculate. Spadix: female zone 1.7–2 cm × 7–9 mm, with 3 or 4 whorls of sterile ovaries at apex and 1 or 2 whorls at base; sterile zone 1.1–2.5 cm, slender, tapering distally; male zone yellowish, clavate, cylindric, 1.5–2.2 cm × 4–7 mm. F1. Apr-Sep. 2n = 28, 42.

Subtropical forests, epiphytic, on rocks, cliff ledges; 700–1900 m. Taiwan, Xizang, Yunnan [Bangladesh, Bhutan, India, Indonesia (Java), N Laos, Nepal, Sri Lanka, N Thailand, N Vietnam; Africa, SW Asia, N Australia, Madagascar, Pacific islands].

The tubers are poisonous. They are used externally to treat mastitis, traumatic injuries, abscesses, and swellings.

早花岩芋 zao hua yan yu

Remusatia hookeriana Schott; Remusatia ornata (Schott) H. Li & Q. F. Guo.

Herbs, cormous. Tuber dark outside, white inside, depressed globose, 0.5–3 × 0.5–3 cm; new roots and buds appearing at apex in Apr–May; stolons much branched, spreading, pendulous, sometimes simple and creeping; bulbils numerous, smaller. Cataphylls white, lanceolate, ca. 9 cm, membranous, convolute around both leaf and flower buds. Leaves 2, appearing in Jun (after anthesis), spreading one after another; petiole tinged reddish, with darker markings, up to 45 cm × ca. 8 mm; leaf blade becoming purple abaxially, green adaxially, ovate-lanceolate, first petiole up to 30 × 13 cm, membranous, peti- tate and cordate at base, long acuminate at apex; second leaf appearing from sheath in proximal part of petiole of first leaf, petiole 10–20 cm, leaf blade smaller, ca. 14 × 4.5 cm. Flow- ering before leaves develop. Peduncle greenish, 4–13 cm × 1.5– 3.5 mm. Spathe 3–7 cm; tube convolute, green outside, dark purple inside, globose, ca. 4 cm in diam.; bulbiferous stolons spreading, creeping, slender, bulbils ellipsoid, 1–3 mm, covered by 4 or 5 scales, bristles filiform and hooked, in scale axils bearing some secondary small bulbils. Leaves 2–4; petiole cylindrical, 40–60 cm; leaf blade pale green abaxially, green adaxially, ovate, 20–30 × 17– 20 cm, subleathery, base petulate and cordate, sinus 4–7 cm; primary veins 4 or 5 on each side, radiating from petiole and pinnately from midrib of main lobe, secondary venation arching-anastomosing, fine intramarginal vein absent. Inflores- cences 1–3, flowering when leaves develop; peduncle green, cylindric, 11–17 cm. Spathe tube green outside and inside, ovate-elliptic, ca. 3 × 1.2 cm, leathery, apex strongly con- stricted; limb initially erect, later spreading and soon reflexed, light purple within and dull purple beneath, base yellowish on both surfaces, obovate-oblong, ca. 8.5 × 3 cm. Spadix: female zone subcylindric, ca. 15 × 6 mm, densely flowered; female flowers 4-carpellate; ovary 1-loculed, green, ovoid, ca. 2 mm; ovules many, basal, suberect; stigma sessile, circular; sterile zone yellow, ca. 14 mm, slender; male zone yellow, broadly cylindric, ca. 17 × 4 mm, attenuate toward base, apex obtuse; synandria of 4 or 5 fused stamens; common filament obconic, apex truncate; thecae 8–10, obovoid, adnate to outside of fila- ment and opening by a terminal pore. Fl. Aug–Sep. 2n = 28*.

- Dense rain forests; ca. 1100 m. Yunnan (Yingjiang).

The combination Remusatia yunnanensis was attempted twice but was not validly published (Vienna Code, Art. 33.4) because the basionym reference was omitted (H. Li & A. Hay, Moscow Aroid Conference 1992 Programme & Abstracts, 36. 1992) and the page number of the basionym reference was omitted (H. Li & A. Hay, Acta Bot. Yunnan., Suppl. 5: 28, 32. 1992).

Caladium pumilum D. Don, Prodr. Fl. Nepal. 21. 1825; Colocasia pumila (D. Don) Kunth; Gonatanthus pumilus (D. Don) Engler & K. Krause; G. sarmentosus Klotzsch; Remusatia garrettii Gagnepain.

Tuber yellowish brown outside, globose, 1–2.5 cm in diam.; bulbiferous stolons spreading, creeping, slender, branched; bulbils many, covered by brown scales; bristles filiform, hooked. Leaves 3 or 4; petiole green, cylindric, 15–40 cm, proximal 1/4–1/3 sheathing; leaf blade dull green on both surfaces, areas between primary veins sometimes purple abaxi- ally and/or adaxially, ovate to oblong-ovate, 8–23.5 × 7–14.5 cm, papery, base petulate and shallowly cordate, apex acute or slightly acuminate, sinus 5–45 mm; primary veins 4 or 5 on each side, radiating from petiole and pinnately from midrib of main lobe, secondary venation pinnate from primary veins, fine intramarginal vein present. Inflorescence solitary, flowering when leaves develop; peduncle green, 6–10 cm. Spathe tube green, narrowly ovoid, 12–15 × ca. 10 mm; limb semispreading to erect, yellow or yellow-green on both surfaces, areas between primary veins sometimes purple abaxially and/or adaxially, ovate to oblong-ovate, 8–23.5 × 7–14.5 cm, papery, base petulate and shallowly cordate, apex acute or slightly acuminate, sinus 5–45 mm; primary veins 4 or 5 on each side, radiating from petiole and pinnately from midrib of main lobe, secondary venation pinnate from primary veins, fine intramarginal vein present. Inflorescence solitary, flowering when leaves develop; peduncle green, 6–10 cm. Spathes of the female zone forming a chamber enclosing the male zone.

Dense evergreen forests, on mossy rocks or trees, and banks; 1000–2800 m. S Xizang, Yunnan [Bhutan, India, Nepal, N Thailand].

This species is readily distinguished from the other three species by the spadix limb being constricted above the spadix as well as between the female and male zones forming a chamber enclosing the male zone of the spadix.

芋属  yu shu

Li Heng (李恒 Li Hen); Peter C. Boyce

*Leucocasia* Schott.

Herbs, seasonally dormant or evergreen, small, medium sized, or gigantic, latex-bearing. Stem either a hypogaeal, subglobose or subcylindric tuber or mostly epigeal, massive. Leaves several, rosetulate in acaulescent plants, forming a terminal crown in arborescent species. Petiole glabrous, sometimes strikingly glaucous, rarely pubescent, sheath rather long; leaf blade peltate, ovate-cordate, abaxially glabrous, glaucous, pruinose, rarely pilose; posterior lobes rounded, shortly to almost entirely connate; basal ribs well developed, primary lateral veins pinnate, forming submarginal collective vein, 1 or 2 marginal veins also present, secondary and tertiary laterals arising from primaries at a wide angle, then arching strongly toward leaf margin and forming inconspicuous interprimar terminal collective veins, higher order venation reticulate. Inflorescences 1 to many per each floral symposium, appearing with leaves; peduncle mostly shorter than petioles. Spathe constricted between tube and limb, sometimes with a second weaker constriction above male zone of spadix; tube persistent, enlarging in fruit and then splitting open irregularly from apex, with convolute margins, usually much shorter than limb, ovoid or oblong; limb either remaining erect, and ± furled, or opening and then reflexed at anthesis, later deciduous, white or yellow, very narrowly lanceolate to oblong or boat-shaped. Spadix sessile, shorter than spathe; female zone short, separated from male by narrower zone of sterile male flowers or contiguous with male zone; male zone cylindric to fusiform; terminal appendix erect, ± smooth, narrowly conic to fusiform or subulate, sometimes reduced to a small, mucronate stub, or absent. Flowers unisexual, naked. Ovary ovoid or oblong, 1-loculed; ovules many, hemiorthotropous; funicles relatively long; placenta 2-5, parietal; style region short, narrowed or not, sometimes ± absent; stigma disciform-capitate or weakly lobed. Interstaminal staminodes present in some species, these weakly clavate, equaling associated pistil; interfetal synandrodes rather long; placentae 2-5, parietal; stylar region short, sometimes ± absent; stigma disciform-capitate or weakly mucronate.

About 20 species: tropical and subtropical Asia; six species in China.

芋属 meng la yu

Herbs, terrestrial, stoloniferous. Rhizome 20–40 × 3–7 cm; stolons 6–10 per plant, pale green, trailing horizontally, simple, 15–20 cm × ca. 4 mm; internodes cylindric, ca. 4 cm, without tubercles. Leaves 5 or 6 together; petiole pale greenish, cylindric, ca. 50 × 1 cm, pubescent, proximal half sheathing; leaf blade pale green abaxially, glossy green adaxially, peltate, ovate-cordate, ca. 40 × 25 cm, membranous, pilose; primary lateral veins 7–9 pairs, sharply raised abaxially; marginal vein 1–3 mm from margin, inconspicuous. Inflorescences (2 or)3(or 4); peduncle pale green, cylindric, shorter than petioles, ca. 20 cm, pubescent. Spathe greenish, constricted between proximal tubular part and limb, proximal part nearly fusiform, 3–6 × ca. 1.2 cm; limb basally open, apically convolute, erect, not reflexed, yellowish, oblong-lanceolate, 13–18 × 4–6 cm. Spadix sessile, shorter than spathe; female zone green, cylindric, ca. 2 × 1 cm, separated from male zone by a narrower zone of synandrodes; ovary ovoid to oblong, ca. 1.5 mm, 1-locular; placenta 4 or 5, parietal; stylist region short; stigma disciform-capitate; sterile
between female and male zones cylindric, ca. 1 cm × 6 mm; sterile male flowers: synandrodes depressed obpyramidal, apex subtruncate; male zone yellowish, cylindric, ca. 3.5 cm × 7 mm; male flowers 8–11-androecious; thecae oblong-linear, dehiscing by apical pore; appendix pale yellowish, narrowly conic, ca. 3.5 × 0.5 cm, rugose at base. Berry not seen. Fl. Mar–Jun.

By streams at humid forest margins; 1000–1100 m. Yunnan (Mengla) [Laos, N Myanmar (Bhamo), N Thailand].

大野芋 da ye yu

*Caladium giganteum* Blume, Cat. Gew. Buitenzorg, 103. 1823; *Leucocasia gigantea* (Blume) Schott.

Herbs, large to gigantic, evergreen, with massive, stout epigeal stem. Leaves very large; petiole pale green, strikingly pruinose, to 2.5 m, proximal half sheathing; leaf blade white pruinose abaxially, especially when immature, green or pale green adaxially, ovate-cordate, 25–250 × 17–150 cm, membranous, base cordate, peltate, margin undulate, apex shortly acuminate. Inflorescences 5–13 arising from leaf axil (actually terminal on shoot and displaced by new shoot); peduncle pruinose, cylindric, 30–80 × 1–2 cm, each with a membranous cataphyll nearly equaling length of peduncle. Spatha 12–24 cm; tube green, ellipsoid, 3–6 × 1.5–2 cm; limb erect, white, oblong-boat-shaped, distinctly constricted, 8–19 × 2–3 cm. Spadix 9–20 cm; female zone white or cream-colored, conic; sterile zone 3–4.5 cm, slender; male zone 5–14 cm; appendix very short, 1–5 mm, apex acute. Berry oblong, ca. 5 mm. Seeds many, fusiform, with many distinct longitudinal striations. Fl. Apr–Jun, fr. Sep. 2n = 28.

Valley forests, limestone-association, usually on moist but well-drained sites, also cultivated; 100–700 m. Fujian, Guangdong, Guangxi, Jiangxi, Yunnan; cultivated in Anhui, Guizhou, Hunan, Sichuan, and Zhejiang [Cambodia, Laos, Malaysia (Peninsular), Myanmar, Thailand, Vietnam; widely cultivated in SE Asia].

Pl. 2: 965. 1753; *A. colocasia* Linnaeus; *Caladium colocasia* (Linnaeus) W.ight; *C. esculentum* (Linnaeus) Ventenat; *Calla gaby* Blanco; *Colocasia antiquorum* Schott var. *esculenta* (Linnaeus) Schott ex Seemann; *C. formosana* Hayata; *C. konishii* Hayata; *C. neocaledonica* Van Houtte.

Rhizome vertical to horizontal, tuberous, 3–5 cm or more (up to 15 cm) in diam. Stolons long or absent. Leaves 2 or 3 or more; petiole green, 25–80 cm, sheathing for 1/3–2/3 length; leaf blade adaxially matte waxy-glaucous and water-shedding (water sometimes forming “mercury droplets”), oblong-ovate to suborbicular, 13–45 × 10–35 cm, base shallowly cordate (sinus 1–4 cm), apex broadly and shortly cuspidate. Peduncle usually solitary, 16–26 cm. Spathae tube green, 3.5–5 × 1.2–1.5 cm; limb open proximally, cream-colored to golden yellow, lanceolate or elliptic, 10–19 × 2–5 cm, apex acuminate. Spadix: female zone conic, 3.5–5 × ca. 1.2 cm; ovary 1–3 mm in diam.; stigma subsessile, narrower than apex of ovary; sterile zone narrowly cylindric, 3–3.3 cm; sterile flowers (pistils) seen from above elongate, ca. 0.5 mm in diam.; male zone cylindric, 4–6.5 cm × ca. 7 mm; appendix narrowly conic, 15–45 × ca. 2 mm. Berry green, ca. 4 mm. Seeds few; synandria ca. 1 mm high, ca. 0.8 mm in diam. Fl. Feb–Apr (Yunnan), or Aug–Sep (Qin Ling area). 2n = 26, 28, 30, 36, 38, 42, 44, 46, 48, 52, 58, 84, 116.

Widely cultivated usually near farmhouses or in water fields; also naturalized or perhaps native in wet places in forests, valleys, swamps, and at watersides. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hubei, Hunan, Jiangsu, Jiangxi, Sichuan, Taiwan, Yunnan, Zhejiang [widespread in tropics and subtropics].

This very variable species is widely cultivated throughout the tropics, and many wild or naturalized clones are found in S Asia, Malesia, and the Pacific islands. The spathes, spadices, and spadix appendices vary considerably, although the floral organs have not been observed in many cultivated clones. This wide variation is attributable to cultivation selections, escapes, naturalizations, and re-domestications. It seems best, therefore, to treat *Colocasia esculenta* as a single species rather than formally recognize infraspecific taxa or segregate species (see Hay, Sandakania 7: 31–48. 1996).

The rhizomes, petioles, and inflorescences are used as a vegetable. The rhizomes are used medicinally for treating swellings, abscesses, snake and insect bites, and swollen lymph nodes in the neck.

滇南芋 dian nan yu

*Caladium esculenta* (Linnaeus) Schott var. *antiquorum* (Schott) F. T. Hubbard & Rehder; *C. fontanesii* Schott; *C. gaoligongensis* H. Li & C. L. Long; *C. gongii* C. L. Long & H. Li; *C. ihengiae* C. L. Long & K. M. Li; *C. tonoino* Nakai.

Herbs, perennial, terrestrial, with stolons (stoloniferous runners) and a usually erect rhizome. Rhizome 120–135 × 12–18 cm; stolons (stoloniferous runners) 6–12, trailing horizontally, pale green to pale purple, simple, thin, 70–80 × ca. 0.5 cm; internodes cylindric, 15–25 cm, without tubercles. Leaves 4–8 together; petiole light green to reddish purple, 55–140 cm, sheathing in basal 1/2; leaf blade pale green or yellow-green abaxially, sometimes with a purple margin, green or yellow-green adaxially, glossy and wettable (water forming an even coating), peltate, ovate-cordate to sagittate-cordate, 30–80 × 18–70 cm, membranous; primary lateral veins 5–9, pale green or purple, interprimary veins inconspicuous. Inflorescences 3–5(or 6); peduncle green or purple, cylindric or subtrigonom, shorter than petioles, 40–70 × 1.5–2 cm. Spathae constricted between tube and blade; tube yellowish green or purple, obleng, 4–12 × 1.4–4.5 cm, subcylindric; limb convolute at base, suberect to reflexed, golden yellow, sometimes with purple margin, obleng, obleng-lanceolate, or obovate, 7–24 × 4–14 cm, apex obtuse or acute. Spadix sessile, shorter than spathae; female zone golden yellow, cylindric, 2–3 × 0.3–0.75 cm, ca. 1/2 as long as spadix, with a few yellow interpistillar staminodes; female flowers obovoid; ovary 1-loculed; placentae 2; stigma

**ARACEAE**
sessile or subsessile, disciform, 6-lobed; sterile zone whitish, cylindric, 1–5 × 0.3–1.8 cm; synandrodes depressed obpyramidal; male zone yellow, cylindric, 3.5–14 × 0.4–1.5 cm; synandria 3–10-androus, yellow, 1–2 mm; appendix absent or erect, narrowly conic, ca. 5 cm. Fruit not seen. Fl. May–Sept. 2n = 28.

Dense rain forests, evergreen broad-leaved forests, and forest margins in valleys in limestone areas, along streams in evergreen broad-leaved forests, moist shaded thickets; 600–1200 m. S and W Yunnan (Mengla, Tengchong, Yingjiang) [NE India, N Laos, N Myanmar, N Thailand].

5. Colocasia affinis Schott, Bonplandia (Hannover) 7: 28. 1859.

Colocasia bicolor C. L. Long & L. M. Cao.

Herbs, perennial, terrestrial, with stolons and tubercles. Stolons trailing horizontally, pale green, thin, 3.7–40 cm × ca. 4 mm, branched; internodes cylindric, 2.7–9 cm, with tubercles; tuberules triangular or ovate, ca. 2 cm in diam. Leaves 3–7; petiole light green or greenish white, without transverse purple lines, cylindric, 20–45 cm; leaf blade pale green abaxially, green or light green adaxially, with 4–6 pairs of large purple spots (lighter when growing in a very shady environment), petate, ovate-cordate, (5–)16–21 × (4.7–)13–16 cm, membranous; primary lateral veins in 3 or 4 pairs, marginal veins inconspicuous. Inflorescences 1–3; peduncle pale green, cylindric, much shorter than petioles, 6.4–15 cm. Spathe constricted; tube convolute, green, almost cylindric, 1.3–2.7 × 0.6–1.8 cm; limb usually reflexed at anthesis, yellow, greenish white, or yellowish, oblong-lanceolate, 4.2–7.8 × 1.6–3.3 cm. Spadix sessile, shorter than spathe; female zone cylindric, short, 0.9–1.7 cm × 3–8 mm; female flowers green; ovary ovoid; ovules ca. 30; funicle long; placentae parietal; stigma sessile; sterile zone absent between female and male zones or cream-colored, 0.5–0.8 cm × 0.8–2 mm; male zone yellowish, pale pink, or cream-colored, 1–1.7 cm × 2.5–5 mm; male flowers 6–8-androus; stamens connate into a synandrium, yellow; appendix reddish purple, greenish white, or light yellow, cylindric in proximal part but conic in distal part, 1.7–5.1 cm × 1.5–6 mm. Young berry green. Fl. Jun–Aug, fr. Jul–Oct. 2n = 28.

Moist shaded places in forests and at forest margins, hillsides in limestone areas; 800–1400 m. S Yunnan (Jinghong, Lancang, Mengla, Simao) [N Bangladesh, NE India, N Myanmar, Nepal].

假芋 jia yu

Colocasia heterochroma H. Li & Z. X. Wei; C. kerrii Gagnepain; C. tibetensis J. T. Yin; C. yunnanensis C. L. Long & X. Z. Cai.

Herbs, small to somewhat robust, stoloniferous. Rhizome erect, up to 7 × 1–1.5 cm; stolons pale green or pale purple, erect or creeping, mostly simple, 5–60 cm × up to 6 mm, internodes 0.5–1.5 cm, bearing ovoid or cylindric-ovoid tubercles to 3.5 cm in diam., or without tubercles. Leaves 3–8; petiole green, sometimes with transverse purple lines, cylindric, 12–57 cm, sheathing for almost 1/2 length; leaf blade paler or slightly glaucous abaxially, green or with dark purple patches between primary veins adaxially, cordate-peltate, ovate-cordate, or narrowly oblong-ovate, 8–36 × 3.3–29 cm, membranous, apex apiculate; primary lateral veins 5–7. Inflorescences 1–5 together; peduncle green, cylindric, 4–23 cm, slender. Spathe constricted or not between tube and limb; tube green, funnel-form or subcylindric, 1.7–4.2 × 0.7–1.7 cm, margins convolute; limb at anthesis proximally gaping, distally convolute, erect, sometimes slightly reflexed after anthesis, orange-yellow, golden yellow, or yellowish basally, violet apically, narrowly lanceolate to oblong-lanceolate, 5–11.2 × 2.7–4.8 cm, apex long acuminate. Spadix sessile, to 6.5 cm, shorter than spathe; female zone yellow, pale yellowish, or green, conic or cylindric, 1–2.6 cm × 4–6 mm, with 4–6 rows of whitish or yellow staminodes at base; ovary green, speckled white, subglabrous or ovoid to oblong, ca. 1 mm, 1-loculed; placenta 3; stigma sessile or subsessile, disciform-capitate, or disciform at base and tapering distally into a linear point to 0.5 mm; sterile zone present between female and male zones; male zone yellow, cylindric, 1.1–4.6 cm × 3–6 mm; synandria golden yellow, polygonal, 6–12-androus; distal sterile zone (between male zone and appendix) cream-colored, cylindric, 0.5–1.2 cm × 1–3 mm, with white hairs, hairs 10–15 mm at anthesis, disappearing on drying; synandrodes broadly oblong to depressed ovoid or depressed obpyramidal, apex truncate or subtruncate; appendix absent or yellowish, cylindric or narrowly conic, 2.5–4.5 cm × 1–2.5 mm, scally-rough, base distinctly constricted or not, apex acute. Berry ripening yellow, ovoid, ca. 2 mm. Fl. Mar–Sep, fr. Jul–Oct. 2n = 28.

Dense forests, humid forest margins, moist mossy rock faces in forests, valley scrub, moist shaded places along streams; 700–1400 m. SE Xizang (Mêdog), S and W Yunnan [N Bangladesh, Bhutan, NE India, Nepal, Thailand].
juvenile blade peltate, at maturity usually sagittate, less often ± hastate or cordate, but remaining peltate in some species, margin entire or sinuate [or slightly to deeply pinnatifid]; posterior divisions ovate or triangular; basal ribs well developed, wax glands present in axes of primary lateral veins and midrib; primary lateral veins pinnate, forming submarginal collective vein, 1 or 2 closely adjacent marginal veins also present, secondary and tertiary lateral veins arising from primaries at a wide angle, then arching strongly toward leaf margin, sometimes forming interprimary veins, higher order venation reticulate. Inflorescences 1 or 2 to many in each floral sympodium; peduncle usually shorter than petioles. Spathes persistent, erect, convolute, gaping only basally, strongly constricted between tube and blade, rarely not; tube with convolute margins, shorter than limb, ovoid or oblong, persistent and then splitting irregularly in fruit; limb oblong, usually boat-shaped, rarely arching, at anthesis at first erect, then reflexing and later usually deciduous. Spadix sessile, sometimes slightly stipitate, rarely obliquely adnate to spathe, shorter than spathe; female zone conical-cylindric, short, separated from male by a much narrower zone of sterile flowers; male zone usually cylindric; appendix conic to cylindric, with irregular, labyrinthine network of fissures. Flowers unisexual, naked. Pistil ovoid or oblong, 1-loculed or partially 3- or 4-loculed at apex; ovules 6–10, orthotropous, hemiorthotropous, hemianatropous, or anatropous; funicle short; placenta basal; stilar region short; stigma depressed capitate, ± distinctly 3- or 4-lobed. Male flowers 3–12(–36)-androus; stamens connate into obpyramidal, subhexagonal, truncate, rarely linear, synandria; thecae oblong to linear-oblong, lateral, dehiscing by apical pore; synandrodes shallow, obpyramidal, compressed, truncate. Fruit a reddish, ellipsoid or obconic-ellipsoid or subglobose odorless berry, 1–5-seeded; stigma remnants persistent. Seed subglobose to ellipsoid, rather large; testa thickish, smooth or scabrous; embryo broadly conic, broadly cylindric, or elongate; endosperm copious.

About 80 species: tropical Asia and Malaysia; eight species in China.

The genus *Alocasia* is vegetatively similar to *Colocasia* but may be readily differentiated by the presence of wax glands present in axes of the primary lateral veins and midrib on the abaxial surface of the leaf and by the mature fruit that are orange or red, odorless, and contain a few large seeds, this in marked contrast to *Colocasia* in which the fruits are inconspicuously colored, smelly, and contain many tiny seeds in slimy mucilage. In addition, the placentation is basal in *Alocasia* and parietal in *Colocasia*.

In respect to synflorescence architecture, *Alocasia* may be distinguished by the inflorescences that are generally paired, with each pair oriented ± tangential to the stem, whereas *Colocasia* has numerous inflorescences arising in a centrifugal sequence radial to the stem.

In China, *Alocasia cucullata* and *A. macrorrhizos* are never found away from human disturbance.

1a. Plants massive, pachycaul, at least 1 m tall.
   2a. Sinus between posterior leaves naked ............................................................................................................. 4. *A. macrorrhizos*
   2b. Sinus between posterior leaves peltate.
      3a. Plants lacking stolons; spathe deep yellow ........................................................................................................ 3. *A. navicularis*
      3b. Plants with short stolons at base of main stems, these stolons with tubercles at tips; spathe greenish white.
         4a. Petiole to 150 cm; leaf blade ca. 130 × 100 cm; appendix conic, 3–5.5 × 1–2 cm ........................................ 1. *A. odora*
         4b. Petiole 28–30 cm; leaf blade ca. 25 × 13 cm; appendix narrowly conic, ca. 1.1 × 0.3–0.4 cm ............. 2. *A. hainanica*
   1b. Plants not as above, or if taller than 1 m then never massive.
      5a. Plants always seasonally dormant; petiole green, leaf blade not peltate; plant producing long (up to 110 cm) horizontal or spreading stolons tipped with tubercles; spathe purple-pink or whitish, not constricted ................. 6. *A. hypossa*
      5b. Plants rarely seasonally dormant, if so then petiole mottled, leaf blade peltate, and plant never with long stolons; spathe green or white, constricted.
         6a. Stems stoutly erect and basally much branched; leaf blade broadly ovate; only known from areas of human disturbance ............................................................................................................................................. 5. *A. cucullata*
         6b. Stems weakly erect to decumbent, not branching basally; leaf blade various but never broadly ovate; plants of natural forest.
            7a. Petiole purple-brown to pink to green, strikingly obliquely mottled chocolate-brown; leaf blade pendent; stigmas conspicuously lobed ................................................................................................. 7. *A. longiloba*
            7b. Petiole green; leaf blade spreading; stigmas not conspicuously lobed .................................................. 8. *A. acuminata*

海芋 hai yu

*Arum odorum* Roxburgh, Fl. Ind., ed. 1832, 3: 499. 1832; *Alocasia commutata* Schott; *A. tonkinensis* Engler; *Arum odoratum* Heynhold; *Caladium odoratissimum* K. Koch; *Colocasia odoratum* Ker Gawler (1822), not Lodderg (1820); *Colocasia odora* (Roxburgh) Brongniart.

Pachycaul herbs, massive, to 2.5 m, evergreen, with slightly milky latex. Stem erect to decumbent, with short stolons terminating in tubercles arising from base. Leaves several to rather many together, clustered at tips of stems of larger plants; petiole up to 1.5 m, sheath membranous; leaf blade peltate, cordate-sagittate or cordate-ovate, up to 130 × 100 cm, basal margins undulate, apex shortly acuminate; primary lateral veins 9–12 on each side, interprimary veins forming well-defined intermediary collective veins. Inflorescences 2 or 3 together among leaf bases, subtended by membranous cataphylls; peduncle stout, ca. 35 cm, exceeding cataphylls at anthesis. Spathe 13–25 cm, constricted ca. 1/6 of way from base; proximal part green, ovoid; limb cowl-like at anthesis, later
reflexed, then deliquescent, greenish white, broadly oblong-lanceolate, 10–30 × 4–8 cm, membranous. Spadix shorter than spathe, shortly stipitate; female zone 1–2 × ca. 1.5 cm; pistil pale green, ca. 3 mm in diam.; stigmas sessile, weakly 3-lobed, lobes blunt, pale green; sterile zone equaling male zone, ivory, very slightly narrowed corresponding to spathe constriction; synandrodes rhombic-hexagonal, ca. 2.5 mm in diam.; male zone whitish, cylindric, 3–5 × ca. 2 cm; synandria rhombic-hexagonal, convex-topped due to cap-forming synconnective, ca. 1.5 mm in diam.; appendix white, narrowly conic, 3–5.5 × 1–2 cm, equaling ca. 1/3 length of spadix, markedly thicker ca. 1.5 mm in diam.; male zone white, cylindric, 3–4 × ca. 1.5 cm; synandrodes whitish, stained purple, rhombic-hexagonal, ca. 2.5 mm in diam.; pistil mid-green, ca. 3 mm in diam.; stigma sessile, 3- or 4-lobed, lobes blunt, pale green; sterile zone equaling male zone, ivory, narrowed corresponding to spathe constriction; synandrodes whitish, stained purple, rhombic-hexagonal, ca. 2.5 mm in diam.; male zone white, cylindric, 3–4 × ca. 1.5 cm; synandria rhombic-hexagonal, convex-topped due to cap-forming synconnective, ca. 1.5 mm in diam.; appendix white, narrowly conic, 3–4 × 1–2 cm, equaling ca. 1/3 length of spadix, ± same thickness as male zone at base. Fruiting spathe ca. 6 cm. Fruit ripening scarlet, globose, ca. 1 cm in diam.

Primary and secondary tropical rain forests, bamboo thickets, riverbanks, also on limestone; below 1700 m. Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hunan, Jiangxi, Sichuan, Taiwan, Yunnan [Bangladesh, Bhutan, Cambodia, NE India (Assam), Japan (Ryukyu Islands), Laos, Myanmar, Nepal, Thailand].

*Alocasia odora* differs from *A. macrorhizos* in having shortly peltate leaves (vs. deeply cordate at the base with the lateral lobes partially naked in the sinus in *A. macrorhizos*).

The rhizomes are used for treating stomach aches, abdominal pains, cholera, and hernias, and are used externally to treat abscesses and snake and insect bites.

**南海芋** nan hai yu

*Alocasia hainanensis* K. Krause.

Herbs, medium sized to rather small, evergreen. Stem short, epigeal. Leaves few together; petiole 28–32 × ca. 1 cm, slender, sheathing to ca. 1/2 length; leaf blade weakly peltate, ovate-sagittate, ca. 25 × 13 cm, thinly membranous, apex acute; posterior lobes ovate-oblong, 8–10 × ca. 5 cm; lateral veins 4 or 5 on each side. Inflorescences solitary; peduncle cylindrical, slender, ca. 18 cm × 4–5 mm. Spathe ca. 6.5 cm, weakly constricted; tube narrowly ovoid, ca. 15 × 8 mm, glaucous; limb erect, narrowly oblong, ca. 5 × 2 cm, apex long acuminate. Spadix slightly shorter than spathe; female zone cylindric, 1–1.2 cm; pistil ovoid; style short; stigmas ±3- or 4-lobed; sterile zone narrowly cylindric, 6–7 cm × ca. 2 mm; synandrodes depressed, rhombic-hexagonal in outline, ca. 2 × 2.5 mm; male zone ca. 15 × 5 mm; synandria comprised of 6 stamens, rhombic-hexagonal, ca. 2 × 2 mm; appendix narrowly conic, ca. 1.1 × 0.3–0.4 cm, acute. Infructescence and fruit unknown. Fl. Nov.

Secondary forests in valleys. Hainan [N Vietnam].

*Alocasia hainanica* is very doubtfully distinct from *A. odora* and is apparently based on a depauperate form of that species. The Berlin isotype is in better condition than the Kew holotype and shows clearly the glaucous proximal spathe outside, which is typical of *A. odora*. The spadix, while depauperate, fits well with that of *A. odora*. As with several other species of Araceae described from Hainan, field work is required to verify its taxonomic status. The drawing that accompanies the Berlin isotype is somewhat stylized, especially in the depiction of the female zone.

In publishing *Alocasia hainanensis*, Krause appears to have been unaware of Brown’s earlier publication; Krause’s and Brown’s names are homotypic.

**黄苞海芋** huang bao hai yu

Pachycaul herbs, massive, to 1.5 m, evergreen, with milky latex. Stem erect to decumbent. Leaves several together, clustered at tips of stems of larger plants; petiole up to 1.5 m, sheath margins membranous; leaf blade peltate, cordate-ovate, ca. 130 × 120 cm, apex shortly acuminate; primary lateral veins 9–12 on each side. Inflorescences 2 or 3 together among leaf bases; pedunule 40–45 cm, stout, much exceeding cataphylls at anthesis. Spathe 10–20 cm, constricted ca. 1/6 of way from base; proximal part green, ovoid; limb dark yellow, broadly oblong-lanceolate, 18–15 × 4–8 cm, cowl-like at anthesis. Spadix shorter than spathe, shortly stipitate; female zone 1–2 × ca. 1.5 cm; pistil mid-green, ca. 3 mm in diam.; stigmas sessile, 3- or 4-lobed, lobes blunt, pale green; sterile zone equaling male zone, ivory, narrowed corresponding to spathe constriction; synandrodes whitish, stained purple, rhombic-hexagonal, ca. 2.5 mm in diam.; male zone white, cylindric, 3–4 × ca. 1.5 cm; synandria rhombic-hexagonal, convex-topped due to cap-forming synconnective, ca. 1.5 mm in diam.; appendix white, narrowly conic, 3–4 × 1–2 cm, equaling ca. 1/3 length of spadix, ± same thickness as male zone at base. Fruiting spathe ellipsoid, 5–11 cm. Fruit ripening dark red, ellipsoid, ca. 10 × 6 mm.

Moist evergreen lower-montane forests, sometimes on limestone. S Yunnan [N Bangladesh, NE India (Assam), N Laos, N Myanmar, Nepal, N Thailand, N Vietnam].

Pachycaul herbs, massive, to 4 m, evergreen, latex slightly milky. Stem erect, to ca. 1.5 m, decumbent. Leaves several together, clustered at tips of stems in larger plants; petiole to 1.3 m, sheathing in proximal 1/3–1/2; leaf blade light green on both surfaces, ovate-sagittate, bluntly triangular, up to 120 × 50 cm, ± erect, margin entire to very slightly sinuous; posterior lobes 1/3–1/2 length of anterior, somewhat rotund, often overlapping, naked in sinus in mature plants, weakly peltate in juveniles; primary lateral veins ca. 9 on each side of anterior lobe, axillary glands distinct, secondary venation not forming interprimary collective veins. Inflorescences paired among leaf bases, subtended by membranous cataphylls; peduncle barely exceeding cataphylls at anthesis. Spathe 13–35 cm, constricted ca. 1/6 from base; proximal spathe green, ovoid; limb cowl-like at anthesis, later reflexed, then deliquescent, pale yellow, broadly oblong-lanceolate, 10.5–29 cm. Spadix slightly shorter than spathe, shortly stipitate; female zone conic-cylindric, 1–2 × ca. 1.5 cm; pistil pale green, ca. 3 mm in diam.; stigma yellow, sessile, 3–5-lobed; sterile zone slightly equaling female zone, whitish; synandrodes rhombic-hexagonal, 2.5 mm in diam.; male zone whitish, cylindric, 3–7 × ca. 2 cm; synandria 5–9-merous, rhombic-hexagonal, convex-topped, 2 mm in diam.; appendix yellowish, slightly tapering, at least 1/2 length of spadix. Fruiting spathe green, oblong-ellipsoid, ca. 8 cm. Fruit ripening scarlet, ellipsoid, ca. 12 × 8 mm.

Ditches and wet areas of farmlands and wastelands, never away from human disturbance; sea-level to 800 m. S Fujian, Guangdong, Guangxi, Guizhou, Hainan, S Sichuan, Taiwan, S Xizang, Yunnan [originally from tropical Asia; now pantropical].

It is not clear where, if anywhere, *Alorasia macrocarphos* occurs wild. It has evidently been prehistorically distributed widely in tropical Asia as a subsistence crop and is now pantropical by introduction as an ornamental.

尖尾芋 jian wei yu

*Arum cucullatum* Loureiro, Fl. Cochinch. 2: 536. 1790; *Alorasia rugosa* (Desfontaines) Schott; *Caladium cucullatum* (Loureiro) Persoon; *C. rugosum* Desfontaines; *Colocasia cochleata* Miquel; *C. cucullata* (Loureiro) Schott; *C. rugosa* (Desfontaines) Kunth; *Panzhuyia omeiensis* Z. Y. Zhu.

Herbs, clumping, small to medium sized, somewhat robust, to 1 m, evergreen. Stems erect, hypogae, basally much branched. Leaves many together; petiole weakly D-shaped in cross section, 25–30–(80) cm, sheath reaching to ca. 1/2 way, margins membranous; leaf blade broadly ovate-cordate, 10–40 × 7–28 cm, base shallowlycordate, apex acute; primary veins 4 on each side, radiating from petiole, arching, interprimary veins not forming a collective vein. Inflorescences rarely produced, usually solitary, sometimes paired, among leaf bases, subtended by membranous cataphylls; peduncle 20–30 cm. Spathe green, 9–15 cm; proximal spathe 4–8 × ca. 2.5 cm; limb narrowly cymbiform, 5–10 × 3–5 cm. Spadix 8–14 cm; female zone cylindric, 1.5–2.5 cm × ca. 7 mm; sterile zone 2–3 cm × ca. 3 mm; male zone yellow, ca. 3.4 cm × 8 mm; appendix yellowish, narrowly conic, ca. 3.5 cm × 5 mm. Fruit rarely produced, a subglobe berry, 6–8 mm in diam., ripening red. Fl. May.

Watersides, by fields, ?wild or cultivated; below 2000 m. Fujian, Guangdong, Guangxi, Guizhou, Hainan, Sichuan, Taiwan, Yunnan [Bangladesh, NE India (Khasi Hills, Sikkim), Laos, Myanmar, Nepal, Sri Lanka, Thailand, Vietnam].

The plants are used externally for detoxifying viper bites and are also used for treating abscesses, rheumatism, and arthritis. It is an important good-luck plant in Buddhist temples in Laos and Thailand.

紫苞芋 zai hai yu

Herbs, terrestrial or lithophytic, to 100 cm tall, seasonally dormant. Stem erect or a tuberlike rhizome; rhizome ca. 10 × 13.5 cm; stolons numerous per plant, pale green, simple, trailing horizontally or pendent, 56–110 cm, internodes cylindric, ca. 5.5 × up to 1 cm, with light green cataphylls, tubercles produced terminally, to 4 × 3 cm. Leaves 3–6 together; petiole light greenish, glossy, terete to 104 × 3–7.5 cm, sheath to 50 cm, membranous; leaf blade triangular-sagittate, to 82 × 64 cm; basal lobes naked in sinus, membranous, glossy bright green; primary lateral veins 8 per side, conspicuous, interprimary veins forming a feeble collective vein. Inflorescences 2 or 3 together, appearing with leaves; peduncle pale green, cylindric, to 90 cm. Spathe to 28 cm, not constricted between basal convolute part and limb; proximal spathe green, fusiform, ca. 6.5 × 3 cm; limb arched, erect at anthesis, later flopping forward, then deliquescent, purple-pink or whitish, oblong-lanceolate, to 24 × 20 cm. Spadix sessile, shorter than spathe; female zone cylindric, ca. 1.5 × 2 cm; pistil oblong, ca. 5 mm; style short; stigma 3- or 4-lobed; sterile zone cylindric, ca. 5.5 × 1–1.5 cm; synandrodes depressed oblong to depressed ovate, apex truncate or concave; male zone white, cylindric, ca. 3.5 × 2 cm; synandria 5- or 6-merous, rhombic-hexagonal, truncate; appendix white, narrowly conic, to 16.5 × 2.5 cm. Fruiting spathe ellipsoid, ca. 3 × 2.5 cm. Fruit ellipsoid, ca. 1.5 × 0.5 cm, ripening scarlet.

Humid forest margins and exposed areas of forest regrowth in limestone mountains; 900–1000 m. SW Yunnan (Menglian) [N Laos, N Thailand].

*Alorasia amabilis* W. Bull; *A. cochinchenensis* Pierre ex Engler & K. Krause; *A. cuspidata* Engler; *A. lowii* Hooker var. *veitchii* (Lindley) Engler; *A. veitchii* (Lindley) Schott; *Caladium veitchii* Lindley.

Herbs, terrestrial, small to robust, to 150 cm tall, evergreen or seasonally dormant. Stem rhizomatous, elongate, erect to decumbent, sometimes subtuberous, 8–60 × 2–8 cm. Leaves 1–3 together, subtended by lanceolate papery-membranous cataphylls; petiole terete, 30–120 cm, glabrous, sheathing in proximal 1/4, purple-brown to green, strikingly obliquely mottled chocolate-brown; leaf blade pendent, green or flushed with purple abaxially, dark green often with major venation gray-green adaxially, narrowly hastate-sagittate, 27–85 × 14–40 cm; posterior lobes petlate for (5–)10–30% of their length, acute, anterior lobe with 4–5 primary lateral veins on each side, axillary glands conspicuous, interprimary collective veins weak. In-
florescences solitary or paired; peduncle 8–18 cm, resembling petioles, subtended by cataphylls. Spathe 7–17 cm, abruptly constricted 1.5–3.5 cm from base; proximal spathe green, ovoid; limb erect, later reflexing, pale green, lanceolate, canoe-shaped, 5.5–7.5 cm. Spadix somewhat shorter than spathe, 6–13 cm, stipitate, stipel whitish, conic, ca. 5 mm; female zone 1–1.5 cm; pistil green, subglobose, 1.5–2 mm in diam.; stigma white, sub sessile or on a slender style to ca. 0.5 mm, 3- or 4-lobed; sterile zone 7–10 mm, narrower than fertile zones; synandrodes mostly rhombic-hexagonal, flat-topped; male zone ivory, subcylindric, tapered at base, 1.2–2.5 cm × 4.5–8 mm; synandria 4–6-merous, ± hexagonal, ca. 2 mm in diam.; appendix pale orange, 3.5–9 cm, subcylindric, tapering to a point. Fruiting spathe glossy green, ovoid, 4–7 cm. Fruit ripening orange-red, globose-ellipsoid, ca. 1.5 × 0.75 cm. Fr. Aug–Oct.

Tropical forests, thickets; 100–1000 m. Guangdong, Hainan, S Yunnan [Cambodia, Indonesia, Laos, Malaysia, S Myanmar, Singapore, Thailand, Vietnam].

越境海芋 yue jing hai yu

Herbs, terrestrial, small to medium sized, slightly robust, to 75 cm tall, evergreen. Stem rhizomatous, generally elongate, erect, later decumbent, 8–75 × 2–6 cm. Leaves to 5 together, subtended by lanceolate papery-membranous cataphylls; petiole bright green, 15–80 cm, glabrous, sheathing in proximal 1/4; leaf blade spreading, bright green, narrowly hastate-sagittate to ovate-hastate, 15–60 × 8–20 cm; posterior lobes 1/4–1/3 length of anterior, petelt for 25–30% of their length, acute; anterior lobe with 3–6 primary lateral veins on each side, axillary glands hardly conspicuous, interprimary collective veins weakly defined. Inflorescences usually solitary; peduncle green, 9–20 cm, subtended by cataphylls. Spathe 7–10 cm, moderately constricted 1.5–2.5 cm from base; proximal spathe green, ovoid; limb pale green, lanceolate, canoe-shaped, 5.5–7.5 cm. Spadix subequalling spathe, 6–9.5 cm, sessile; female zone 1–1.5 cm; pistil green, subglobose, 1.5–2 mm in diam.; stigma white, sub sessile, very slightly lobed; sterile zone 7–10 mm, narrower than fertile zones; synandrodes narrowly rhombic-hexagonal, flat-topped; male zone ivory, subcylindric, 1.2–2.5 cm × 4.5–8 mm; synandria 4–6-merous, ± hexagonal, ca. 2 mm in diam.; appendix white, 2.5–3.5 cm, demarcated from male zone by a strong constriction, narrowly conic. Fruiting spathe green, ovoid, 3–4 cm. Fruit ripening orange-red, globose-ellipsoid, ca. 0.75 cm in diam.

Everwet to seasonal perfumed evergreen forests, usually in deep shade, less often on track sides; 600–1800 m. S Yunnan [Bangladesh, NE India, N Laos, N Myanmar, Nepal, N Thailand, ?N Vietnam].

大漂属 da piao shu

Li Heng (李恒 Li Hen); Peter C. Boyce

Apiospermum Klotzsch; Kodda-Pail Adanson.

Herbs, small, free-floating, evergreen, stoloniferous, acaulescent, with spreading feathery roots. Leaves several in a rosette, densely pubescent; petiole very short, almost absent; sheath ligulate, very short, very thin, scarious at base; leaf blade obovate-oblong, somewhat spongy, apex rounded, truncate, or retuse; midrib absent, primary veins subparallel, all arising from base, diverging slightly and running to margin near apex, strongly prominent abaxially, higher order venation reticulate. Inflorescence solitary, very small, much shorter than leaves; peduncle very short, pubescent. Spathe somewhat constricted centrally, pubescent outside, glabrous inside, proximal margins ciliate with each other and with ovary half forming tube, free margins between tube and blade folded between stigma and male organs forming a partition between a distal male partial chamber and a proximal female one; limb erect, ovate, expanded, acute-acuminate. Spadix shorter than spathe, mostly adnate to spathe, only apical male zone free; female zone with single gynoecium at base and a thin, green, pouch-shaped flap just below spathe partition; male zone subtended by a thin, marginally lobed, green, annular flap, consisting of a basally naked spadix axis supporting a single whorl of 2–8 flowers, naked axis sometimes extending slightly beyond. Flowers unisexual, naked. Gynoecium obliquely adnate to spadix axis; ovary ovoid, 1-loculed; ovules numerous, orthotropous; placenta broad, apparently parietal, probably morphologically basal; stylar region attenuate, bending inward toward male flowers; stigma disciform-subcapitate, small. Male flower a synandrium consisting of 2 connate stamens; thecae dehiscent by single apical slit. Fruit a thin-walled, utricular, several-seeded, ellipsoid berry, irregularly breaking ovate-hastate, 1–1.5 cm. Fl. May–Nov.
